Appendix C - New-Indy Catawba Responses to Comments

1. INTRODUCTION

New-Indy Catawba, LLC (New-Indy) submits this air dispersion modeling analysis in response to paragraph 5 of the Order to Correct Undesirable Level of Air Contaminants (Order) issued by the South Carolina Department of Health and Environmental Control (SCDHEC or DHEC) on May 7, 2021. This report has been revised to address comments on the original August 30 report received from SCDHEC and the United States Environmental Protection Agency (U. S. EPA or EPA) on September 10, September 14, September 17 and October 6. The New-Indy Catawba responses to all comments are included in Appendix C.

By way of background, until late 2020, New-Indy and its predecessor owners of the mill in Catawba, South Carolina (Facility or Mill) produced bleached paper, operating under Title V Operating Permit (TVOP) #2440-0005, issued on May 7, 2019 and effective on July 1, 2019. Given the substantial decrease in demand for such paper, the Mill was becoming more economically unviable. Thus, New-Indy made the decision to convert from producing bleached white paper to unbleached containerboard at the Mill. Commencing in spring 2020, the Mill replaced the outdated bleached paper-making equipment with state-of-the-art equipment to make lightweight ultra-high strength containerboard and retrained its union workforce to operate and maintain this very sophisticated Facility. The Mill began post-project operations on February 1, 2021. In late January and February, New-Indy and DHEC began receiving complaints from local citizens regarding odors.

Per paragraph 5 of the Order, New-Indy was required to perform testing and evaluation of total reduced sulfur (TRS), hydrogen sulfide (H_2S), and sulfur dioxide (SO_2) emissions at the Mill. Tests to verify emissions estimates included TRS, H_2S, and SO_2 emissions from the following stacks or vents:

- Paper Machine 2 and 3 vents
- Kraft non-condensable gases (NCG) system, including evaporator sets
- Pulp Dryer
- Steam Stripper inlet and outlet and combustion boiler outlet

To comply with paragraph 5 of the Order, New-Indy conducted a facility-wide air dispersion modeling analysis of TRS, H_2S, and SO_2 emissions. This facility-wide air dispersion modeling analysis includes the following sections:

- **Section 1: Introduction** - provides general information regarding the Mill and the purpose of the air dispersion modeling analysis.
- **Section 2: Background** - provides an overview of the Mill's current configuration and operations.
- **Section 3: Emissions Inventory** - provides an inventory for all Mill sources of TRS, H_2S, and SO_2 emissions. Documentation describing the emissions estimation methods and sample calculations is provided in Appendix A.
- **Section 4: Air Dispersion Modeling Requirements** - provides a review of state air quality regulations applicable to paragraph 5 of the Order.
- **Section 5: Air Dispersion Modeling Analysis** - provides the air quality modeling analysis conducted to satisfy paragraph 5 of the Order. Supporting materials are provided in Appendix B.
- **Appendix A – Emissions Calculations**
- **Appendix B – Modeling Files**

2. BACKGROUND

New-Indy operates a kraft pulp and paper mill located at 5300 Cureton Ferry Rd, Catawba, South Carolina, in York County. The Mill operates under TVOP #2440-0005 that was issued by DHEC on May 7, 2019, became effective on July 1, 2019, and expires on June 30, 2024. New-Indy was issued Construction Permit #2440-0005-DF on July 23, 2019, in accordance with state and federal air quality regulations and standards, to allow the Mill to modify its processes to convert from bleached paper production to brown paper production. The construction permit was revised on May 13, 2020 to allow the Mill to hard pipe its condensates to the wastewater treatment plant. 40 CFR Part 63, Subpart S, the National Emission Standards for Hazardous Air Pollutants (NESHAP) from the Pulp and Paper Industry, allows this hard piping as a compliance option. New-Indy began post-project operations of the Mill as an integrated pulp and paper facility manufacturing brown paper on February 1, 2021.

In response to the odor complaints, on March 12, 2021, New-Indy began consultation with LDX Solutions (LDX) regarding utilization of the steam stripper as opposed to hard piping the foul condensate. With the approval of DHEC, New-Indy returned the foul condensate steam stripper to operation on May 3, 2021.

DHEC issued the Order to New-Indy to correct undesirable levels of air contaminants. Paragraph 5 of the Order requires New-Indy to perform testing and evaluation of TRS, H_2S, and SO_2 emissions at the Mill, and submit a facility-wide air dispersion modeling analysis of TRS, H_2S, and SO_2 emissions. The required testing was performed June 21-27, 2021.

2.1 MILL LOCATION

The Mill is located in York County on the west bank of the Catawba River, approximately one kilometer (km) southeast of the unincorporated community of Catawba and 14 km southeast of the city of Rock Hill, South Carolina. The geographical coordinates for the approximate center of the Mill are:

- Universal Transverse Mercator (UTM) Easting: 509,741 meters (m)
- UTM Northing: 3,855,660 m
- UTM Zone: 17
- North American Datum (NAD): 1983
- Longitude (degrees, minutes, seconds): 80° 53' 36.43" W
- Latitude (degrees, minutes, seconds): 34° 50' 35.52" N

A facility location map of the Mill is provided as Figure 2-1. York County is located in the Piedmont, characterized by low rolling hills and complex terrain. Elevations vary from approximately 130 m to 230 m above mean sea level (AMSL) within 10 km of the Mill, with higher elevations to the west. Topography surrounding the Mill is presented in Figure 2-2. The area within 3 km of the Mill is predominantly agricultural and rural.

2.2 MILL BACKGROUND

The Mill is under the jurisdiction of the following state and federal agencies:

South Carolina Department of Health and Environmental Control
Bureau of Air Quality
2600 Bull Street
Columbia, SC 29201

United States Environmental Protection Agency - Region 4
Sam Nunn Atlanta Federal Center
61 Forsyth Street, SW
Atlanta, GA 30303

The original pulp mill was constructed in 1959, which included a woodyard area for the processing of raw material, a kraft mill to chemically process wood chips into pulp, a pulp dryer, a chemical recovery area to recycle process chemicals, a utilities area to generate steam and electricity, a waste treatment area, and other operations.

In 1962, a paper machine (No. 1 paper machine) and a groundwood pulping process were added to the facility to facilitate the production of paper. In 1968, an additional paper machine (No. 3 paper machine) was installed and the groundwood pulping process was expanded. In 1978, a thermo-mechanical pulping (TMP) process was added to the facility. In 1986, the groundwood and TMP pulping processes were eliminated, while a new paper machine (No. 2 paper

Air Dispersion Modeling Analysis

Figure 2-2
Topographical Map

machine) was installed to increase the production of paper, and a new TMP process was added to replace the original TMP process.

In 2003, the original kraft pulping system and bleach plant were replaced with a state-of-the-art kraft fiber line and bleaching system. In addition, the No. 3 paper machine was converted from newsprint to coated paper production, and the TMP was re-configured to support only coated paper production. In 2011, the kraft pulping system and bleaching system were modified to increase production, while using the same amount of wood furnish and cooking chemicals.

In 2020, the Mill was converted from manufacturing bleached pulp, suitable for manufacturing bleached lightweight coated paper and market pulp, to unbleached pulp, suitable for manufacturing linerboard and other unbleached pulp and paper products. The conversion resulted in retirement of the bleaching system, the TMP plant, the No. 1 paper machine and several other operations. Although not currently running, the No. 2 paper machine remains permitted and is in standby for potential future use, as markets allow.

2.3 MILL PROCESS DESCRIPTION

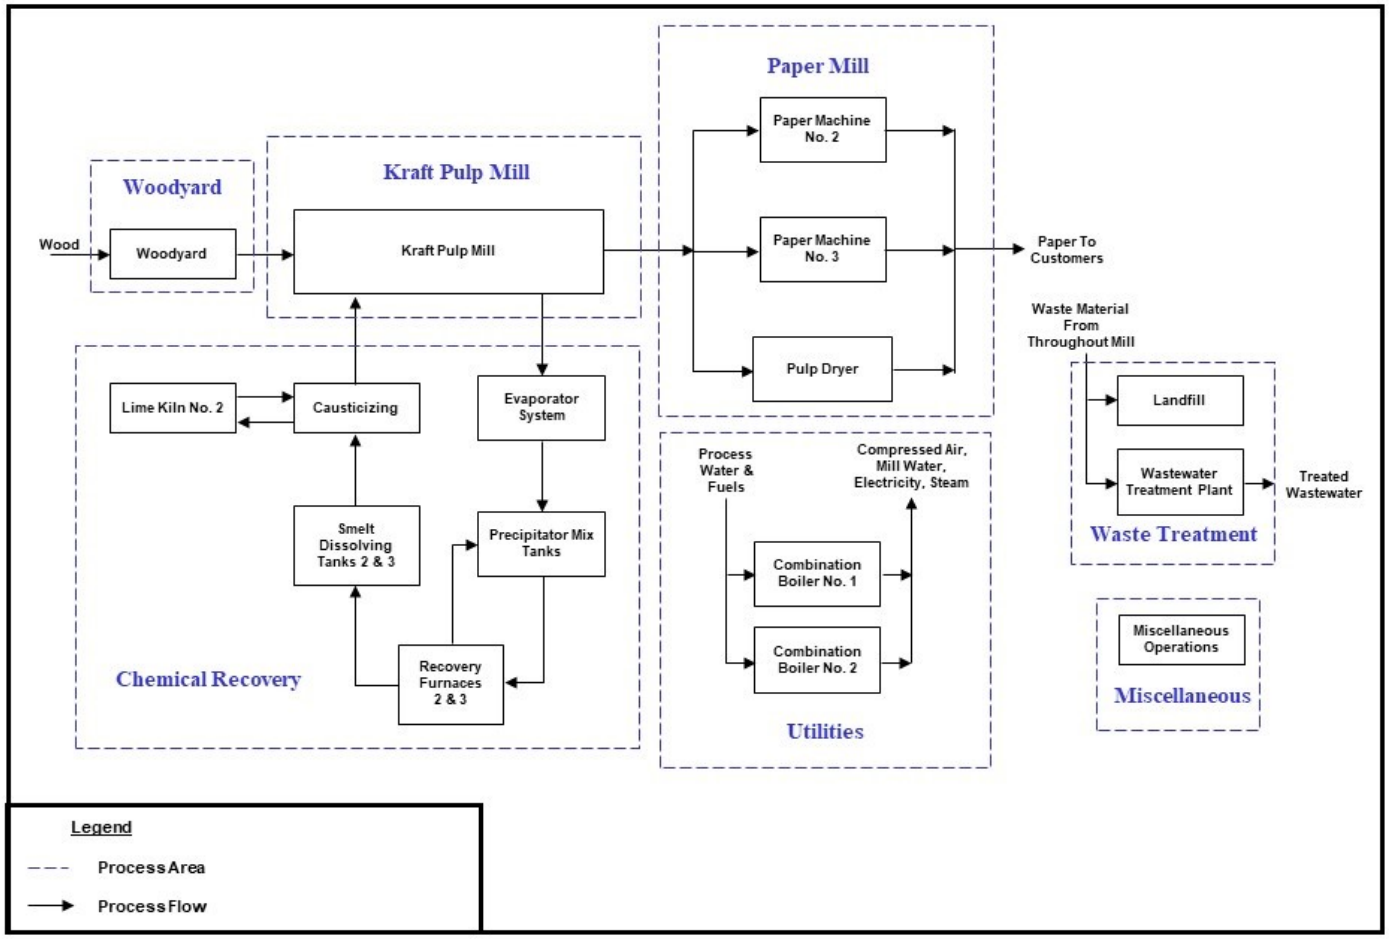
The Mill is comprised of seven distinct process areas, which include the following: the woodyard area, the kraft pulp mill area, the paper mill area, the chemical recovery area, the utilities area, the waste treatment area, and a miscellaneous area. A process flow diagram for these process areas has been included as Figure 2-3. An overall description of the process areas is found below.

The woodyard receives southern pine logs and chips for the Mill. Logs are debarked and chipped, and the chips are screened prior to storage for use within the pulping processes. Likewise, wood chips received at the Mill are screened, and processed as needed, prior to use within the pulping processes.

The kraft (sulfate) process area is used to produce pulp. Pulp from the kraft process is produced from “cooking” wood chips in a caustic solution at an elevated temperature and pressure.

Figure 2-3

Mill Process Flow Diagram



The paper mill area produces linerboard (the outside layer in a corrugated container) on one state-of-the-art paper machine. Unbleached market pulp is produced on one pulp dryer.

The chemical recovery area has recovery furnaces and a causticizing area. The recovery furnaces, which are auxiliary to the kraft process, burn the organics extracted from the chips and recover cooking chemicals. The causticizing area utilizes the chemicals recovered by the recovery furnaces, and after the addition of lime, provides the cooking chemicals for the kraft process.

The utilities area produces steam and electricity for facility-wide use by two combination boilers.

The waste treatment area receives wastewater and mill waste (solid waste) from the previously mentioned areas of the Mill. Wastewater undergoes biological treatment to remove the dissolved organic wastes prior to discharge into the receiving stream. Mill solid waste is deposited within an on-site landfill for disposal.

The miscellaneous areas include everything which is not captured in one of the aforementioned process operating areas, including the facility roads and the pulp storage tanks.

3. EMISSIONS INVENTORY

This section describes the emissions calculations, the basis of emissions factors, and pertinent supporting data for the emissions units that are part of the air dispersion modeling analysis. Additional supporting tables, emissions factors, and related emissions inventory documentation are provided in Appendix A.

3.1 SO_2 EMISSIONS

The SO_2 emissions were determined following the same approach as the air dispersion modeling submitted in November 2016 and approved by DHEC and the U. S. EPA for demonstrating compliance with the SO_2 Data Requirements Rule (DRR). The emissions from No. 6 fuel oil combustion in the combination boilers and recovery furnaces were determined using the actual hourly fuel combustion assuming the maximum sulfur content of the fuel oil. These emissions are presented in Tables A-41 through A-46 of Appendix A.

The SO_2 emissions from the combustion of pulp mill NCG and stripper-off-gases (SOG) were determined based on the June 2021 source testing performed by Weston Solutions, Inc. (Weston) required under Condition 5 of the Order[1]. The SO_2 emissions from each test were divided by the pulp production during the test to establish the emissions factor in pounds of SO_2 per ton of pulp production. The highest average emissions factor from the June 2021 tests was multiplied by the future pulp production rate in the June 2019 and April 2020 Project Columbia construction permit applications (Construction Permit 2440-0005-DF). Detailed emissions calculations for this source based on the source testing conducted in June 2021 are presented in Table A-5 of Appendix A.

The SO_2 emissions from all other fuels and processes were based on the February 2021 Title V permit modification request to incorporate Construction Permit 2440-0005-DF. The SO_2 emissions from the sources retired by Construction Permit 2440-0005-DF (power boiler and paper

[1] Weston Solutions 2021 – "Pulp Dryer, No. 3 Paper Machine Vents, No. 2 and 3 Smelt Dissolving Tank Vents, and No. 1 and 2 Combination Boilers Emission Test Report", October 1, 2021.

machine coaters) are not included. These emissions are presented in Tables A-47 through A-51 of Appendix A.

3.2 TRS AND H_2S EMISSIONS

The H_2S and TRS (as H_2S) emissions are based on site-specific stack test data, site-specific data used in conjunction with published U.S. EPA or National Council for Air and Stream Improvement (NCASI) air emission models or factors, or published NCASI emissions factors. H_2S and TRS (as H_2S) emissions were determined based on source testing performed by Weston required under Condition 5 of the Order for the combustion of pulp mill NCG and SOG, the paper machines and pulp dryer, and the smelt dissolving tanks. The emissions from each test were divided by the pulp production during the test to establish the emissions factor in pounds of H_2S and TRS (as H_2S) per ton of pulp production. The average emissions factor from the June 2021 tests was multiplied by the future production rates in the June 2019 and April 2020 Project Columbia construction permit applications (Construction Permit 2440-0005-DF) and February 2021 Title V permit modification request to incorporate Construction Permit DF. The No. 2 paper machine has yet to be returned to operation following the conversion. The emissions factors from the No. 3 paper machine were used to estimate the H_2S and TRS (as H_2S) emissions from the No. 2 paper machine. Detailed emissions calculations for each source based on the source testing conducted in June 2021 are presented in Tables A-2 through A-6 of Appendix A.

The H_2S and TRS (as H_2S) emissions from the wastewater treatment system were determined based on liquid samples collected in July 2021 under Condition 2 of the Order. The liquid sample results obtained from the analysis methods required by U.S. EPA using the Method Detection Limit for non-detect values were submitted under separate cover on October 5, 2021. The July 2021 liquid sample results are coupled with the NCASI wastewater Hydrogen Sulfide Emissions Simulator (H2SSIM) emissions model for H_2S emissions from the primary clarifier and the aeration stabilization basin (ASB). The U.S. EPA WATER9 air emissions model and information from NCASI Technical Bulletins 956 and 1000 were used to estimate the H_2S emissions from the remaining wastewater system sources. The post aeration basin H_2S emissions were measured at

the outlet of the vent covering the basin. The emissions of the other TRS compounds (methyl mercaptan, dimethyl sulfide and dimethyl disulfide) were calculated using WATER9 and converted into an H_2S basis using the molecular weights of each compound. The average emissions from the wastewater treatment system were divided by the average pulp production during the July 2021 tests and multiplied by the future pulp production rate in the June 2019 and April 2020 Project Columbia construction permit applications (Construction Permit 2440-0005-DF) and the February 2021 Title V permit modification request to incorporate Construction Permit DF. Detailed emissions calculations for each source based on the liquid samples from the wastewater treatment system collected in July 2021 are presented in Tables A-7 through A-17 of Appendix A. The WATER9 inputs and model outputs are presented in Tables A-35 through A-40, along with the H2SSIM model inputs and outputs and NCASI information where applicable.

The H_2S and TRS (as H_2S) emissions from all other processes are based on the February 2021 Title V permit modification request to incorporate Construction Permit DF. Detailed emissions calculations for each source from the Title V permit modification request are reproduced in Tables A-18 through A-34 of Appendix A.

4. AIR DISPERSION MODELING REQUIREMENTS

To satisfy Condition 5 of the Order, the Mill has reviewed DHEC air quality regulations to evaluate applicability to the air dispersion modeling analysis. DHEC has promulgated air pollution control standards under Regulation 61-62.5. This air dispersion modeling analysis addresses requirements under Regulation 61-62.5 Standard No. 2 and Standard No. 8. Although the regulations specifically apply to facilities requesting an air quality permit from the BAQ, and not to the Order, the air dispersion modeling analysis followed the regulatory guidance as part of the compliance demonstration.

The current Clean Air Act (CAA) Section 107 attainment status designations for areas within the state of South Carolina are summarized in 40 CFR §81.341. York County is in attainment or unclassifiable/attainment for all regulated NSR pollutants.

4.1 STANDARD NO. 2 – AMBIENT AIR QUALITY STANDARDS

DHEC Regulation 61-62.5 Standard No. 2 sets maximum ambient air quality standards (AAQS) for criteria pollutants, including SO_2. AAQS standards are aligned with National Ambient Air Quality Standards (NAAQS). Appropriate design value background concentrations must be added to model-predicted ambient concentrations from the Facility prior to the determination of compliance when conducting NAAQS air dispersion modeling demonstrations.

4.2 STANDARD NO. 8 – TOXIC AIR POLLUTANTS

DHEC Regulation 61-62.5 Standard No. 8 regulates air toxics and establishes maximum allowable (24-hour average) ambient concentrations (MAAC) for each. Facilities that construct, alter, or add to a source of a regulated air toxic after June 28, 1991 must comply with the standard, which includes a demonstration that ambient concentrations of each air toxic emitted from the facility must not exceed the associated 24-hour average MAACs. The South Carolina Modeling Guidelines for Air Quality Permits (October 2018, revised 4/15/2019) provide an exemption from

demonstrating compliance with Standard No. 8 for sources subject to, and in compliance with, one or more National Emission Standards for Hazardous Air Pollutants (a.k.a. Maximum Achievable Control Technology or MACT Standards). The South Carolina modeling guidelines also exclude lagoons from inclusion in Standard No. 8 compliance demonstrations.

5. AIR DISPERSION MODELING ANALYSIS

To comply with Condition 5 of the DHEC Order, a facility-wide air dispersion modeling analysis was conducted to directly evaluate TRS, H_2S, and SO_2 emissions from the Mill with MAAC standards under DHEC Standard No. 8 and AAQS standards under Standard No. 2. As a MAAC standard does not exist for TRS, TRS was evaluated as H_2S for comparison to Standard No. 8. At the request of DHEC and EPA, New-Indy Catawba also modeled the 1-hour concentrations for H_2S and TRS (as H_2S) and compared the maximum modeled concentrations to the EPA 30-minute action level of 600 ppb (837 $\mu g/m^3$).

Modeled emissions rates were determined by permitted emissions rates and emissions estimates verified during the source testing conducted in June 2021 for the No. 2 and No. 3 paper machines, kraft NCGs (including evaporator sets), the pulp dryer, and the steam stripper and combustion boilers outlet. Modeled emissions accounted for possible fugitive emissions associated with the wastewater pond, holding pond, basins, and other wastewater systems.

A summary of the emissions rates and modeling approach used in, and the results of, the compliance demonstration are presented in the subsequent sections. Supporting information related to the air quality modeling analysis is provided in Appendix B.

5.1 EMISSIONS RATES

Emissions rates were calculated based on maximum actual emissions for sources included in the July 2021 stack testing. Emissions rates for remaining sources are based on permitted emissions rates. Detailed emissions calculations for each model source are discussed in Section 3 and are presented in Appendix A.

Modeled emissions rates are presented in Table 5-1.

Table 5-1

5.2 AIR DISPERSION MODELING APPROACH

This section contains information on the technical approach that was followed in the air dispersion modeling analysis, the air dispersion model selection, and the model options that were used. The supporting information used in the air quality analysis includes terrain data, meteorological data, and a building downwash analysis. The modeling analysis was performed in accordance with the SCDHEC guidance document, "Modeling Guidelines for Air Quality Permits"[2], revised April 15, 2019, and 40 CFR Part 51, Appendix W, "Guideline on Air Quality Models" (Appendix W)[3].

5.2.1 Air Dispersion Model Selection

The air dispersion modeling analysis was conducted using the American Meteorological Society/Environmental Protection Agency (AMS/EPA) Regulatory Model (AERMOD) modeling system to perform refined modeling. AERMOD is the U.S. EPA's preferred model for refined regulatory modeling analyses, as specified in Appendix W.

The AERMOD modeling system consists of two pre-processors and the main dispersion model. AERMAP is the terrain pre-processor and AERMET is the meteorological pre-processor. AERMAP characterizes the surrounding terrain and can generate elevations for sources, structures, and receptors within the modeling domain. AERMET is used to generate an hourly profile of meteorological conditions and boundary layer characteristics. In addition, two non-regulatory programs (AERMINUTE and AERSURFACE) are available for preparing inputs to AERMET. AERMINUTE is recommended for use when incorporating meteorological data from National Weather Service (NWS) Automated Surface Observing System (ASOS) sites to reduce the number of calms and missing winds in AERMOD (Appendix W). AERSURFACE is used to determine surface roughness lengths, noontime albedo, and daytime Bowen ratio inputs to AERMET. The modeling incorporated the following program versions, which were current at the time of the

[2] SC DHEC 2019 - "Modeling Guidelines for Air Quality Permits", April 2019
[3] U.S. EPA 2017 – 40 CFR Part 51 Appendix W "Guideline on Air Quality Models", 2017.

analysis (with the exception of the AERMET version used by DHEC to develop the meteorological inputs[4]):

- AERMINUTE 15272
- AERSURFACE 20060
- AERMET 19191
- AERMAP 18081
- AERMOD 21112
- BPIPPRIM 04274

AERMOD has user-selectable options that may be chosen to configure a dispersion model for regulatory and non-regulatory applications. In this case, the modeling will be performed for a regulatory application. Therefore, regulatory default options are proposed for the modeling, including the following:

- Stack-tip Downwash
- Accounting of Elevated Terrain Effects
- Calms Processing Routine
- Missing Data Processing Routine
- No Exponential Decay for Rural Mode
- ADJ_U*

5.2.2 Land Use Analysis

Appendix W specifies a procedure, based on Auer[5], to determine whether land usage surrounding the modeled source is primarily urban or rural. There are two methods that can be used for performing this procedure: a land use classification or population density evaluation. The land use classification procedure is considered the more definitive methodology (Appendix W) and was applied in the air dispersion modeling analysis.

The land use classification determination involves quantifying land use areas by Auer's land use categories within a 3-km radius of the modeled facility. Urban dispersion coefficients should be

[4] SC DHEC 2021 – "2015-2019 Meteorological Data Processing Using AERMET Version 19191", April 2021.
[5] Auer 1978 – "Correlation of Land Use and Cover with Meteorological Anomalies", Journal of Applied Meteorology, 17:636-643, 1978.

selected if greater than 50 percent of the area evaluated consists of urban land use types (industrial, commercial, compact residential); otherwise, rural dispersion coefficients should be used.

The population density procedure uses the same 3-km radius as described in the Land Use Classification procedure, with population within the area determined from Census Bureau Enumeration District data. If the population density within the 3-kilometer radius exceeds 750 people per square kilometer, the area should be modeled with urban dispersion coefficients.

Visual inspection of satellite and aerial imagery does not suggest that greater than 50 percent of the area within 3 km of the Mill is urban. Therefore, rural dispersion coefficients were used in the modeling.

5.2.3 Receptors and Terrain

The AERMOD terrain pre-processor AERMAP was used to process 1 arc-second (approximately 30-m) United States Geological Survey (USGS) National Elevation Dataset (NED) files, in Georeferenced Tagged Image File Format (GeoTIFF) format, to create ground elevation and hill height scales for each receptor in a 40-km by 40-km domain, centered on the approximate Mill center. Modeling incorporates North American Datum of 1983 (NAD83) horizontal datum.

Two receptor networks were utilized in the air dispersion modeling analysis. For SO_2 modeling, receptors were placed along the boundary approved by DHEC and U.S. EPA in the air dispersion modeling submitted for the SO_2 DRR. For TRS and H_2S modeling, the Facility property boundary was used. In both cases, in accordance with DHEC guidance, receptors were placed at 50-meter intervals along the boundary, on property not owned by the Mill, and in publicly accessible locations. In response to comments received from DHEC on September 10 and September 14, additional receptors were placed at 50-meter spacing along property boundaries for parcels not owned by the Mill, but were located within the Mill property boundary. Receptors were also placed at 50-meter intervals within the parcels not owned by the Mill. Publicly accessible locations include the CSX and Norfolk Southern rail lines, Cureton Ferry Road, and South Carolina

Highway 5. Beyond the boundary for each receptor network, a Cartesian receptor network was used, with receptor spacing:

- 100 m spacing from the property line to ± 5 km,
- 500 m spacing from ± 5 km to ± 10 km, and
- 2,500 m spacing from ± 10 km to ± 40 km.

A plot of the inner portion of the receptor network for SO_2 modeling is shown in Figure 5-1. The inner portion of the receptor network for evaluation of air toxics is shown in Figure 5-2.

5.2.4 Meteorological Data

U.S. EPA recommends that AERMOD be run with a minimum of 5 years of off-site data or 1 year of on-site meteorological data to "*acquire enough meteorological data to ensure worst-case meteorological conditions are adequately represented in the model results*"[6]. DHEC guidance requires inclusion of DHEC-provided, pre-processed, 5-year meteorological datasets for refined air dispersion modeling analyses. DHEC provides meteorological datasets for 12 areas, based on BAQ determination of meteorological stations deemed to be the most representative for each area. For York County, DHEC recommends the dataset consisting of surface data from Weather Bureau Army Navy (WBAN) station ID 53871 - Rock Hill Airport – Bryant Field (KUZA) in Rock Hill, South Carolina, and upper air data from WBAN station ID 13723 - Piedmont Triad International Airport (KGSO) in Greensboro, North Carolina. The 5-year meteorological dataset (2015-2019) was processed by DHEC using AERMET version 19191, includes a minimum wind speed threshold of 0.5 meters per second, and includes the application of the ADJ_U* option.

Selection of a representative meteorological dataset must include consideration for terrain and proximity to adequately characterize boundary layer conditions that would be expected at the Mill. The Rock Hill Airport is in the vicinity of the Mill, located approximately 21 km to the northwest, has similar surrounding land use characteristics, and has a base elevation of 204 m AMSL. The

similar land use and distance from the Mill support the use of the KUZA meteorological dataset as representative for the Mill.

5.2.5 GEP Stack Height Analysis

A Good Engineering Practice (GEP) stack height analysis was conducted to evaluate if stack emissions are subject to building wake effects and aerodynamic downwash caused by buildings included in the modeling, in accordance with the Guideline for Determination of Good Engineering Practice Stack Height[7]. If a stack is sufficiently close to a building or, if located adjacent or on a building, the plume from the stack can be entrained in the building's wake, diminishing plume rise can result in increased ground level ambient concentrations. Facilities with stack heights below their corresponding GEP formula heights must account for potential building wake effects within the modeling performed for them.

There are two definitions of GEP stack height: formula GEP stack height and regulatory GEP stack height. U.S. EPA requires building downwash effects to be evaluated for nearby buildings when a stack is less than formula GEP stack height. Regulatory GEP stack height is the greater of 65 meters or formula GEP stack height. Formula GEP stack height is defined as:

$$H_{GEP} = H_B + 1.5L_B$$

where:

H_{GEP} = formula GEP stack height,
H_B = the building's height above stack base, and
L_B = the lesser of the building's height or maximum projected width.

The current version of U.S. EPA's Building Profile Input Program for PRIME (BPIPPRM) was used to calculate wind direction-specific downwash parameters to evaluate stacks considered close enough to a building to be affected by downwash, defined as the lesser of 0.8 kilometer or $5L_B$ of the building in any wind direction. Due to the use of BPIPPRM and associated cavity algorithms, a separate cavity analysis was not performed.

A visualization of Mill stacks and relevant structures is presented in Figure 5-3.

5.2.6 Source Characterization

The emissions units at the Mill include sources that exhaust through a stack or vent and sources that represent a fugitive release. The physical release characteristics for emissions units included in the air quality modeling analyses are provided in Table 5-2 (point sources), Table 5-3 (volume sources), and Table 5-4 (area sources).

With the exception of the post-aeration basin (Model ID: "POSTAERB"), each of the stacks included in the modeling are uncapped and have a vertical release orientation and were represented using the AERMOD POINT source type. Modeled stack exit temperatures, stack heights, exit velocities, and stack diameters for each stack were obtained from the source testing performed in June 2021.

The post-aeration basin stack was modeled with a horizontal release. The post-aeration basin, which was upfitted with a new cover and carbon filter on June 9, 2021, does not have a heat-based release and was represented with an ambient release in the modeling.

Fugitive emissions associated with storage tanks, mix tanks, and waste treatment sources were characterized as area sources. Emissions from high-density (HD) and low-density (LD) pulp storage tanks were collectively modeled as a single source ("PULPSTOR"). Similarly, emissions from strong black liquor storage tanks and weak black liquor storage tanks were collectively modeled as a single source ("BLAKSTOR"). Emissions from the precipitator mix tank ("MIXTANK") and the white liquor storage tank ("WLIQSTOR") were modeled using the AREA source type, with rotation angles determined using aerial imagery. The clarifier ("CLARIFY") was modeled using the AREACIRC source type with a 42-m radius. Each of the waste treatment sources were modeled using the AREAPOLY source type and same square meter footprint as the emissions modeling to accurately represent both the shape and the active footprint of each source and provide consistency with emissions rates calculations. Initial vertical dispersion was not applied to area sources. Fugitive emissions from the causticizer ("CAUST"), which included emissions from green liquor storage tanks, were characterized as a VOLUME source, with an elevated release height and initial vertical dimension divided by 4.3.

(a) AREAPOLY modeled area presented based on emissions model area.

5.2.7 Background Ambient Air Data

Ambient background 1-hour and 3-hour SO_2 concentrations were considered for the Standard No. 2 AAQS compliance demonstration. The Mill added SO_2 design concentrations, maintained by DHEC, representing the most-recent three years maintained by DHEC (2017-2019) from the Greenville Employment Security Commission (ESC) ambient monitor (Site ID: 45-045-0015) located in Greenville, South Carolina.

Although the Greenville ESC ambient monitoring site is not the closest ambient monitor to the Mill, the closer sites in Lexington and Richland Counties are in more urban areas near Columbia. The Greenville ESC monitoring station is located in similar topography and land use as the Mill. Based on the similarities, the Greenville ESC monitor is representative of the conditions at the Mill.

SO_2 design values included in the air dispersion modeling analysis (post-model) are presented in Table 5-5.

Table 5-5
Background Concentrations

Pollutant	Averaging Period	Design Value Form	Design Value ($\mu g/m^3$)
SO_2	1-hour	99th percentile of daily maximum 1-hour averaged over 3 years	2.6
	3-hour	3-hour 2nd-High averaged over 3 years	3.8

5.3 AIR QUALITY MODELING RESULTS

Model-predicted ambient concentrations were compared to AAQS and MAAC to demonstrate compliance with Standard No. 2 and Standard No. 8, respectively. In addition, 1-hour model-predicted concentrations for H_2S and TRS were evaluated against the U.S. EPA 30-minute H_2S

Action Level. The air dispersion modeling analysis demonstrates that Mill-wide emissions of TRS (as H_2S), H_2S, and SO_2 are below the respective compliance levels for all averaging periods (Table 5-6).

5.3.1 South Carolina Standard No. 2 Results

Model-predicted ambient concentrations of SO_2 at 1-hour and 3-hour averaging periods were compared to AAQS. Representative background concentrations were added to the modeled concentrations after modeling was conducted. The results of the AAQS analysis demonstrate that Mill-wide SO_2 emissions do not cause an AAQS violation.

5.3.2 South Carolina Standard No. 8 Results

Model-predicted ambient concentrations of TRS (as H_2S) and H_2S at a 24-hour averaging period were compared to respective MAAC. The results of the air dispersion modeling analysis demonstrate that Mill-wide TRS (as H_2S) and H_2S emissions do not cause any MAAC violations.

Table 5-6
Summary of Air Dispersion Modeling Results

Pollutant	Averaging Period[1]	Rank	Modeled Concentration (µg/m³)	Background (µg/m³)	Total (µg/m³)	AAQS/ MAAC/ Action Level (µg/m³)[2]	Compliant (Y/N)
SO_2	1-hour	4th-High Average Daily Maximum	141.16	2.6	143.76	196	Y
	3-hour	1st-High	182.89	3.8	186.69	1,300	Y
H_2S	24-hour	1st-High	14.26	-	14.26	140	Y
	30-minute	1st-High	73.28	-	73.28	837	Y
TRS	24-hour	1st-High	52.17	-	52.17	140	Y
	30-minute	1st-High	383.94	-	383.94	837	Y

1 H_2S and TRS 1st highest 1-hour modeled concentrations compared to 30-minute U.S. EPA Action Levels.

2 TRS is not subject to a MAAC. For the purpose of this analysis, TRS as H_2S is evaluated using the H_2S MAAC.

Spatial representation of model-predicted ambient concentrations are provided in Figure 5-4, Figure 5-5, Figure 5-6, Figure 5-7, Figure 5-8, and Figure 5-9. Background concentrations were not included in the concentration contour plots, as they were added post-model.

PART II. CHEMICAL-SPECIFIC INFORMATION FOR HYDROGEN SULFIDE

The NCASI Handbook for SARA 313 Reporting and underlying Chemical-Specific Information Sheets (CISs) are intended to serve as an information resource to facilities in fulfilling their reporting requirements. These documents are not meant to replace engineering judgement, site-specific considerations or other technical knowledge.

SECTION 1. TOXIC CHEMICAL IDENTITY

In this Section, a facility describes the SARA 313 chemical.

1.1 CAS Number – 7783-06-04

1.2 Toxic Chemical or Chemical Category Name - Hydrogen Sulfide

1.3 Generic Chemical Name –

This Section applies only for trade secret submissions**.**

SECTION 2. MIXTURE COMPONENT IDENTITY

Report the generic name in this Section if the facility and the supplier both claim the chemical identity as proprietary or trade secret. A facility that seeks to use this section should consult the TRI Reporting Instructions for more information.

SECTION 3. ACTIVITIES AND USES OF THE TOXIC CHEMICAL AT THE FACILITY

In this Section, indicate the threshold category, or categories, exceeded for the specific SARA 313 Chemical. Note that while amounts of threshold activity are not reported in this section, a facility may wish to have supporting threshold calculations available for review.

3.1 Manufacture the toxic chemical:

Trace quantities of hydrogen sulfide may be manufactured as a byproduct during (a) pulp bleaching, and (b) chemical recovery operations. For determining whether the manufacturing threshold has been exceeded, four categories should be considered: (1) total air emissions, (2) amount present in non-condensable gases (NCGs) sent for incineration, (3) amount released to the wastewater treatment plant (WWTP), and (4) amount present in strong liquors as-fired.

TABLE 4 WWTP PARTITIONING AND EMISSIONS OF HYDROGEN SULFIDE[a]

	PRIMARY CLARIFIER (PC) n = 4	AERATED STABILIZATION BASIN (ASB) n = 3	ACTIVATED SLUDGE TREATMENT (AST) n = 1
Percent Volatilized	0.3 – 3.4% Mean = 1.4%	0.3 – 35% Mean = 8.8%	1.5%
Percent Biodegraded	--	65 – 99.7%	98.5%
Percent in Effluent	96.6 – 99.7% Mean = 98.6%	<0.1%	<0.1%
Percent Overall Removal	Mean = 1.4%	>99.9%	>99.9%

	PRIMARY SETTLING BASIN (PSB) n = 2	SLUDGE POND (SP) n = 6
Emission Factor[b]	0.88 – 54.1 lb/(day Acre) Mean = 20.2 lb/(day Acre)	0.04 – 10.8 lb/(day Acre) Mean = 4.2 lb/(day Acre)
Sulfide Generation Factor[c]	1.5 – 3.8 x Inlet Load Mean = 2.4 x Inlet Load	N/A

[a] NCASI 2008
[b] Emission factors for PSBs and SPs are a function of *free liquid* surface
[c] This value can be used to estimate the sulfide generated in a primary settling basin

3.2 Process the toxic chemical:

The SARA Section 313 regulations define "processing" as an incorporative activity; the level of this threshold activity therefore depends on how much of the chemical is intended to remain in the finished product. While hydrogen sulfide is generally not "processed" in this industry, facilities may wish to review the content of any additives used in the process.

3.3 Otherwise use the toxic chemical:

This would be the sum of all the hydrogen sulfide used at the manufacturing site in ancillary activities. A 10,000 lb/yr reporting threshold applies for this category. While hydrogen sulfide is generally not "otherwise used" in this industry, facilities may wish to review the content of their fuels, chemical and processing aids and other chemicals on site.

SECTION 4. MAXIMUM AMOUNT OF THE TOXIC CHEMICAL ON-SITE AT ANY TIME DURING THE CALENDAR YEAR

4.1 _____ (Enter two-digit code from instruction package.)

In this Section, report the range of weights of the SARA 313 chemical that is on-site "at any time during the calendar year". A facility should calculate or estimate the maximum quantity of hydrogen sulfide that is on-site and then report using the range codes in the TRI instructions.

3.2 Sulfide Dissociation

Inorganic, free sulfide can exist in three forms, the concentrations of which depend upon the wastewater pH. H2SSIM calculates the effect of pH on the predominant sulfide form present in the wastewater. This calculation is significant because only H_2S is a volatile form of sulfide.

At the near neutral pH conditions encountered in most wastewaters undergoing biological treatment, hydrogen sulfide dissociates to yield a hydrogen ion and hydrogen sulfide ion (Equation 3.4).

$$H_2S \leftrightarrow H^+ + HS^- \qquad \text{Equation 3.4}$$

At very high pH levels, the hydrogen sulfide ion can dissociate again to a hydrogen ion and sulfur ion (Equation 3.5).

$$HS^- \leftrightarrow H^+ + S^{2-} \qquad \text{Equation 3.5}$$

When the reaction is considered to be at equilibrium, the reaction and concentration products can be defined by Equations 3.6 and 3.7.

$$K_1 = \frac{[H^+][HS^-]}{H_2S} \qquad \text{Equation 3.6}$$

$$K_2 = \frac{[H^+][S^{2-}]}{HS^-} \qquad \text{Equation 3.7}$$

If the reactions represented in Equations 3.4 and 3.5 are considered to occur much faster than the other processes in the overall mass balance equation, a local equilibrium holds (Chapra 1997) and the sulfide dissociation reaction can be solved outside of the sulfide mass balance equation.

If a local equilibrium exists for sulfide dissociation, the fraction of total sulfide that exists as each species at the specified pH can be calculated (Equations 3.8 through 3.10).

$$F_{HS} = \frac{K_1[H^+]}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.8}$$

$$F_{H_2S} = \frac{K_1K_2[H^+]^2}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.9}$$

$$F_S = \frac{1}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.10}$$

Where: F_{HS} = Fraction of total sulfide as HS^-

F_{H2S} = Fraction of total sulfide as H_2S

F_S = Fraction of total sulfide as S^{2-}

The fraction of each sulfide species calculated by these equations with pKa1 = 7.04 and pKa = 11.96 is shown in Figure 3.2.

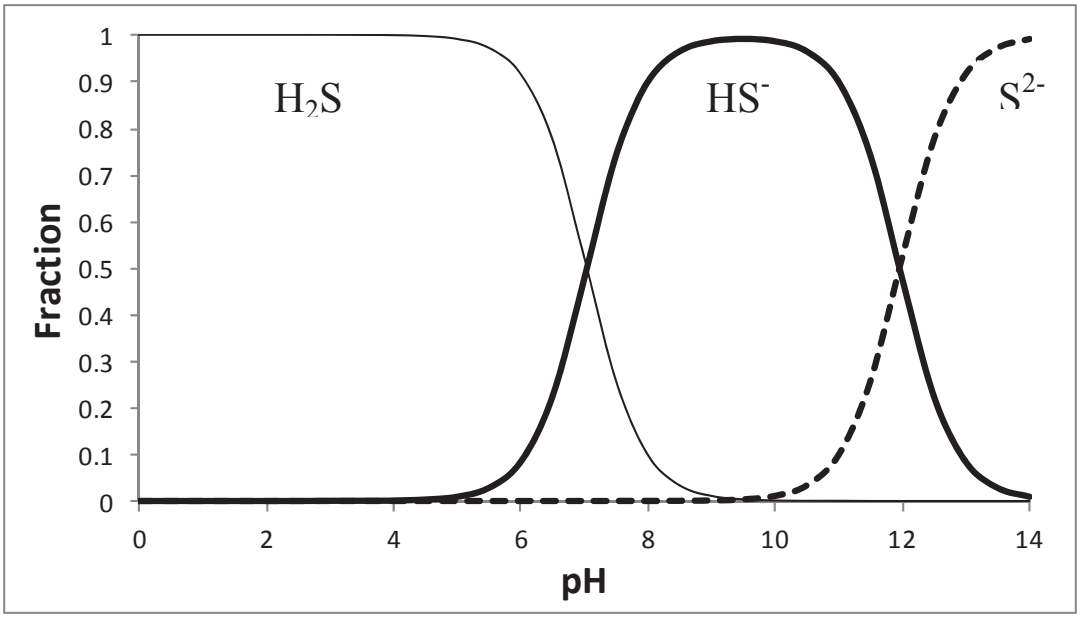

Figure 3.2 Fraction of Sulfide Species as a Function of Wastewater pH

The fractions of each sulfide species are calculated internally by H2SSIM and used to define the concentration of each dissociated form as a function of pH and total sulfide concentration. A critical use of these fractions is calculating the amount of sulfide available to volatilize to the atmosphere as H_2S (i.e., the volatilization term in Equation 3.2).

3.3 Generation of Sulfide in Wastewater

Sulfide can be generated in wastewater when conditions are favorable. These conditions include sufficient concentration of the reactants and an anoxic (i.e., dissolved oxygen is near zero) environment. A quantitative expression relating the sulfide generation rate to temperature, sulfate concentration, and oxygen concentration in pulp and paper wastewaters has been developed based on laboratory batch reactor experiments. The technical details of that study and subsequent equation development are reported in Appendix A.

The expression for sulfide generation in pulp and paper wastewaters is presented in Equation 3.11.

$$R_1 = k_{gen}\left(\frac{SO_4}{K_{SO_4} + SO_4}\right)\left(\frac{K_{DO}}{K_{DO} + DO}\right) \qquad \text{Equation 3.11}$$

Where: R_1 = Sulfide generation rate (M/L^3T)
SO_4 = Sulfate concentration (M/L^3)
DO = Dissolved oxygen concentration (M/L^3)
k_{gen} = Generation rate coefficient at 20 °C (M/L^3T)
K_{SO4} = Sulfate half saturation coefficient (M/L^3)
K_{DO} = Oxygen half saturation coefficient (M/L^3)

Equation 3.11 states that the rate of sulfide generation is proportional to an empirical rate coefficient and may be limited by low sulfate concentrations or the presence of oxygen.

The rate of sulfide generation is also affected by temperature. The optimal temperature for sulfate reducing bacteria has been reported as 25 to 35°C. The temperature correction should account for bacterial inhibition at temperatures greater than 35°C as in Equations 3.12 and 3.13.

When the wastewater temperature is 35°C or less, the model uses

$$k_{Temp} = k_{20}\theta^{Temp-20} \qquad \text{Equation 3.12}$$

Where θ = Temperature coefficient
k_{Temp} = Rate coefficient at actual temperature
k_{20} = rate coefficient at 20°
Temp = Temperature °C

When the wastewater temperature is greater than 35°C, the model uses

$$k_{Temp} = k_{20}\theta^{15} * \theta_2^{Temp-35} \qquad \text{Equation 3.13}$$

Where: θ_2 = Second temperature coefficient

The overall effect of Equations 3.12 and 3.13 is an increasing rate coefficient up to 35 °C. As temperatures increase further, the rate coefficient decreases. Details concerning Equation 3.13 can be found in NCASI (1985b).

3.4 Sulfide Oxidation

Sulfide is oxidized rapidly to sulfate and several intermediate sulfur species when exposed to aerobic conditions. A commonly used sulfide oxidation rate equation was found to adequately describe sulfide oxidation data from pulp and paper mill wastewaters (Palumbo, Brown, and Stratton 2010). This equation is presented here as Equation 3.14.

$$R_2 = k_{ox} S_{-II}{}^{m} (DO)^{n} \qquad \text{Equation 3.14}$$

Where: R_2 = Rate of sulfide oxidation (M/L^3T)
k_{ox} = Aerobic sulfide oxidation coefficient (T^{-1})
S_{-II} = Sulfide concentration (M/L)
DO = Dissolved oxygen concentration (M/L)
m = order of reaction with respect to sulfide (-)
n = order of reaction with respect to oxygen (-)

The sulfide oxidation rate changes as a function of pH. This change is represented in the model through a varying oxidation rate coefficient. The relationship between the rate coefficient and pH is shown in Equation 3.15. The derivation of Equation 3.15 is described in Appendix B.

$$k_{ox} = 7.16 * (1 - \exp(-0.84 * (pH - 6.15)) \qquad \text{Equation 3.15}$$

In Equation 3.15, it is assumed that the oxidation rate coefficient is zero below a pH value of 6.15.

When oxygen is absent, sulfide is more slowly oxidized in wastewaters. The rate of sulfide oxidation under anoxic conditions can be modeled using a modification of Equation 3.14. The development of this equation is presented in Appendix B.

$$R_2 = k_{anox} S_{-II}^{m} \qquad \text{Equation 3.16}$$

Where k_{anox} = Anoxic sulfide oxidation rate coefficient (T^{-1})

[2] H_2S emissions rate (g/s) calculated based on the site-specific liquid H_2S concentration from the July 9-11, 2021 initial performance test (IPT) under 40 CFR 63, Subpart S, adjusted for pH using the NCASI Free Sulfide Tool (as described in NCASI Technical Bulletin 1000, section 3.2), and the site-specific WATER9 program mass transfer coefficient for Ditch #1. Calculations of the fraction of H_2S and the H_2S emissions rate is provided in the attached spreadsheet Ditch #1 Calcs.xlsx. USEPA WATER9 Program, Version 3.0 is posted at: https://www3.epa.gov/ttnchie1/software/water/water9_3/index.html. The basis for the input values and the output files from the WATER9 Program are also attached.

[3] MM, DMS, and DMDS emissions rates (g/s) calculated based on site-specific MM, DMS, and DMDS liquid concentrations from the July 9-11, 2021 IPT and configuration of the Ditch #1 utilizing the USEPA WATER9 Program, Version 3.0, posted at: https://www3.epa.gov/ttnchie1/software/water/water9_3/index.html. The basis for the input values and the output files from the WATER9 Program are also attached.

[4] 3.61E-02 g TRS/s = [(2.10E-04 g H2S/s x 32.07 mol S/g ÷ 34.08 mol H2S/g) + (4.50E-04 g MM/s x 32.07 mol S/g ÷ 48.11 mol MM/g) + (5.04E-02 g DMS/s x 32.07 mol S/g ÷ 62.14 mol DMS/g) + (1.09E-02 g DMDS/s x 64.14 mol S/g ÷ 94.20 mol DMDS/g)] x (34.08 mol H2S/g÷ 32.07 mol S/g)

[5] Ditch 0 is 3.65 meters wide and 61 meters long = 3.65 × 61 = 222.65 sq meters

[6] g TRS/s-sq meter = 3.61E-02 g TRS/s ÷ 2190 sq meters = 1.65E-05 g TRS/s-sq meter

[7] lb TRS/hr = 3.61E-02 g TRS/s x 3600 s/hr ÷ 453.592 g TRS/lb TRS = 2.86E-01 lb TRS/hr

[8] average pulp production during sampling on July 9, 10 and 11 (1694.16, 1609.17, 1355.92 ODTP/day)

[9] lb TRS/ODTP = 2.86E-01 lb TRS/hr x 1 hr/1553.08 ODTP = 4.43E-03 lb TRS/ODTP

[10] maximum production from June 2019 and April 2020 Project Columbia construction permit applications (construction permit DF)

[11] lb TRS/hr = 4.43E-03 lb TRS/ODTP x 2700 ADTP/day x 1 day/24 hr x 0.9 ODTP/1.0 ADTP = 4.48E-01 lb TRS/hr

[12] g TRS/s = 4.48E-01 lb TRS/hr x 453.592 g TRS/lb TRSx 1 hr/3600 s = 5.65E-02 g TRS/s

[13] g TRS/s-sq meter = 5.65E-02 g TRS/s ÷ 2190 sq meters = 2.58E-05 g TRS/s-sq meter

[1] The H2SSIM model was not calibrated for post-aeration basins. However, eleven post-aeration basins (i.e., holding or retention ponds) were tested as part of the NC study published in NCASI TB 956. Two of the eleven post-aeration basins resulted in reported H_2S emissions (all others were not significant based on the screening study results). Based on the stie-specific H2SSIM Model results for New-Indy, worst-case emissions are assumed to be equal to Mill B reported H_2S emissions (0.04 g/s). This H_2S rate is consistent with Zones 2 and 3 H_2S emissions rates and emissions would not expect to be higher than these rates as the Holding Pond is aerated with dissolved oxygen levels at an average of 1.1 across the holding pond during the test (Note: anoxic conditions occur when dissolved oxygen levels near zero per NCASI TB 1000).

9.4 Post-Aeration Basin Emissions

9.4.1 *Post-Aeration Basin Reduced Sulfur Compound Emission*

The results from the reduced sulfur compound emissions testing of post-aeration basins at four mills are summarized in Table 9.12. Two of these were aerated basins that followed one or more aerated basins. Screening studies were conducted at all eleven basins. The screening study results indicated that the reduced sulfur compound emissions were minimal at all but two of those basins. The specific situations relative to those two basins are discussed below.

The screening study results from Mill B indicated significant emissions from the no. 1 retention pond, which immediately follows the ASB. During the screening study, accumulated sludge was visible throughout most of the 62-acre pond. Because of the high level of sludge accumulation in the no. 1 retention pond, the liquid level had to be raised to allow the use of a boat for liquid sample collection. Therefore, the liquid level was raised during the approximately 10-day period between the initial screening study and the start of the full emissions measurement and liquid sample collection study. Additional screening study work during the full emissions measurement study, and the results of the full emissions measurement study, indicated lower H_2S emissions (0.04 g/s) than what were expected based on the initial screening study results. The increase in the liquid level may have resulted in lower than expected H_2S emissions, but other factors cannot be ruled out.

At Mill T, the screening study results indicated significant emissions from the no. 2 retention pond. An H_2S emission rate of 1.0 g/s was estimated from the ground-level concentrations, as described in Section 8.2. At Mill T there are three aerated basins in series, which are followed by two retention ponds in series. There were significant H_2S emissions from the no. 1 ASB. The no. 2 ASB also had significant H_2S emissions due to the presence of kraft process condensates which were hard-piped directly to the no. 2 ASB. The emissions from the no. 3 ASB and the no. 1 retention pond were insignificant. Therefore, the wastewater must have gone anoxic again at some point in the no. 2 retention pond to generate sulfide which was then emitted as H_2S.

At all 11 post-aeration basins, the emissions of the organic reduced sulfur compounds were either non-detect or not significant.

9.4.2 *Post-Aeration Basin Methane Emissions*

Methane emissions were only measured at the Mill B no. 1 retention pond. The results of the methane emission tests as well as basin inlet and outlet TOC data are summarized in Table 9.13. The data show that there was an increase in TOC across the pond. This increase may be due to 1) the formation of water soluble carbon-containing compounds from biological degradation of the settled secondary sludge, and/or 2) fixation of atmospheric carbon dioxide via photosynthetic or other biological means in this large, shallow basin.

PART II. CHEMICAL-SPECIFIC INFORMATION FOR HYDROGEN SULFIDE

The NCASI Handbook for SARA 313 Reporting and underlying Chemical-Specific Information Sheets (CISs) are intended to serve as an information resource to facilities in fulfilling their reporting requirements. These documents are not meant to replace engineering judgement, site-specific considerations or other technical knowledge.

SECTION 1. TOXIC CHEMICAL IDENTITY

In this Section, a facility describes the SARA 313 chemical.

1.1 CAS Number – 7783-06-04

1.2 Toxic Chemical or Chemical Category Name - Hydrogen Sulfide

1.3 Generic Chemical Name –

This Section applies only for trade secret submissions**.**

SECTION 2. MIXTURE COMPONENT IDENTITY

Report the generic name in this Section if the facility and the supplier both claim the chemical identity as proprietary or trade secret. A facility that seeks to use this section should consult the TRI Reporting Instructions for more information.

SECTION 3. ACTIVITIES AND USES OF THE TOXIC CHEMICAL AT THE FACILITY

In this Section, indicate the threshold category, or categories, exceeded for the specific SARA 313 Chemical. Note that while amounts of threshold activity are not reported in this section, a facility may wish to have supporting threshold calculations available for review.

3.1 Manufacture the toxic chemical:

Trace quantities of hydrogen sulfide may be manufactured as a byproduct during (a) pulp bleaching, and (b) chemical recovery operations. For determining whether the manufacturing threshold has been exceeded, four categories should be considered: (1) total air emissions, (2) amount present in non-condensable gases (NCGs) sent for incineration, (3) amount released to the wastewater treatment plant (WWTP), and (4) amount present in strong liquors as-fired.

TABLE 4 WWTP PARTITIONING AND EMISSIONS OF HYDROGEN SULFIDE[a]

	PRIMARY CLARIFIER (PC) n = 4	AERATED STABILIZATION BASIN (ASB) n = 3	ACTIVATED SLUDGE TREATMENT (AST) n = 1
Percent Volatilized	0.3 – 3.4% Mean = 1.4%	0.3 – 35% Mean = 8.8%	1.5%
Percent Biodegraded	--	65 – 99.7%	98.5%
Percent in Effluent	96.6 – 99.7% Mean = 98.6%	<0.1%	<0.1%
Percent Overall Removal	Mean = 1.4%	>99.9%	>99.9%

	PRIMARY SETTLING BASIN (PSB) n = 2	SLUDGE POND (SP) n = 6
Emission Factor[b]	0.88 – 54.1 lb/(day Acre) Mean = 20.2 lb/(day Acre)	0.04 – 10.8 lb/(day Acre) Mean = 4.2 lb/(day Acre)
Sulfide Generation Factor[c]	1.5 – 3.8 x Inlet Load Mean = 2.4 x Inlet Load	N/A

[a] NCASI 2008
[b] Emission factors for PSBs and SPs are a function of *free liquid* surface
[c] This value can be used to estimate the sulfide generated in a primary settling basin

3.2 Process the toxic chemical:

The SARA Section 313 regulations define "processing" as an incorporative activity; the level of this threshold activity therefore depends on how much of the chemical is intended to remain in the finished product. While hydrogen sulfide is generally not "processed" in this industry, facilities may wish to review the content of any additives used in the process.

3.3 Otherwise use the toxic chemical:

This would be the sum of all the hydrogen sulfide used at the manufacturing site in ancillary activities. A 10,000 lb/yr reporting threshold applies for this category. While hydrogen sulfide is generally not "otherwise used" in this industry, facilities may wish to review the content of their fuels, chemical and processing aids and other chemicals on site.

SECTION 4. MAXIMUM AMOUNT OF THE TOXIC CHEMICAL ON-SITE AT ANY TIME DURING THE CALENDAR YEAR

4.1 _____ (Enter two-digit code from instruction package.)

In this Section, report the range of weights of the SARA 313 chemical that is on-site "at any time during the calendar year". A facility should calculate or estimate the maximum quantity of hydrogen sulfide that is on-site and then report using the range codes in the TRI instructions.

3.2 Sulfide Dissociation

Inorganic, free sulfide can exist in three forms, the concentrations of which depend upon the wastewater pH. H2SSIM calculates the effect of pH on the predominant sulfide form present in the wastewater. This calculation is significant because only H_2S is a volatile form of sulfide.

At the near neutral pH conditions encountered in most wastewaters undergoing biological treatment, hydrogen sulfide dissociates to yield a hydrogen ion and hydrogen sulfide ion (Equation 3.4).

$$H_2S \leftrightarrow H^+ + HS^- \qquad \text{Equation 3.4}$$

At very high pH levels, the hydrogen sulfide ion can dissociate again to a hydrogen ion and sulfur ion (Equation 3.5).

$$HS^- \leftrightarrow H^+ + S^{2-} \qquad \text{Equation 3.5}$$

When the reaction is considered to be at equilibrium, the reaction and concentration products can be defined by Equations 3.6 and 3.7.

$$K_1 = \frac{[H^+][HS^-]}{H_2S} \qquad \text{Equation 3.6}$$

$$K_2 = \frac{[H^+][S^{2-}]}{HS^-} \qquad \text{Equation 3.7}$$

If the reactions represented in Equations 3.4 and 3.5 are considered to occur much faster than the other processes in the overall mass balance equation, a local equilibrium holds (Chapra 1997) and the sulfide dissociation reaction can be solved outside of the sulfide mass balance equation.

If a local equilibrium exists for sulfide dissociation, the fraction of total sulfide that exists as each species at the specified pH can be calculated (Equations 3.8 through 3.10).

$$F_{HS} = \frac{K_1[H^+]}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.8}$$

$$F_{H_2S} = \frac{K_1K_2[H^+]^2}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.9}$$

$$F_S = \frac{1}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.10}$$

Where: F_{HS} = Fraction of total sulfide as HS^-

F_{H2S} = Fraction of total sulfide as H_2S

F_S = Fraction of total sulfide as S^{2-}

The fraction of each sulfide species calculated by these equations with pKa1 = 7.04 and pKa = 11.96 is shown in Figure 3.2.

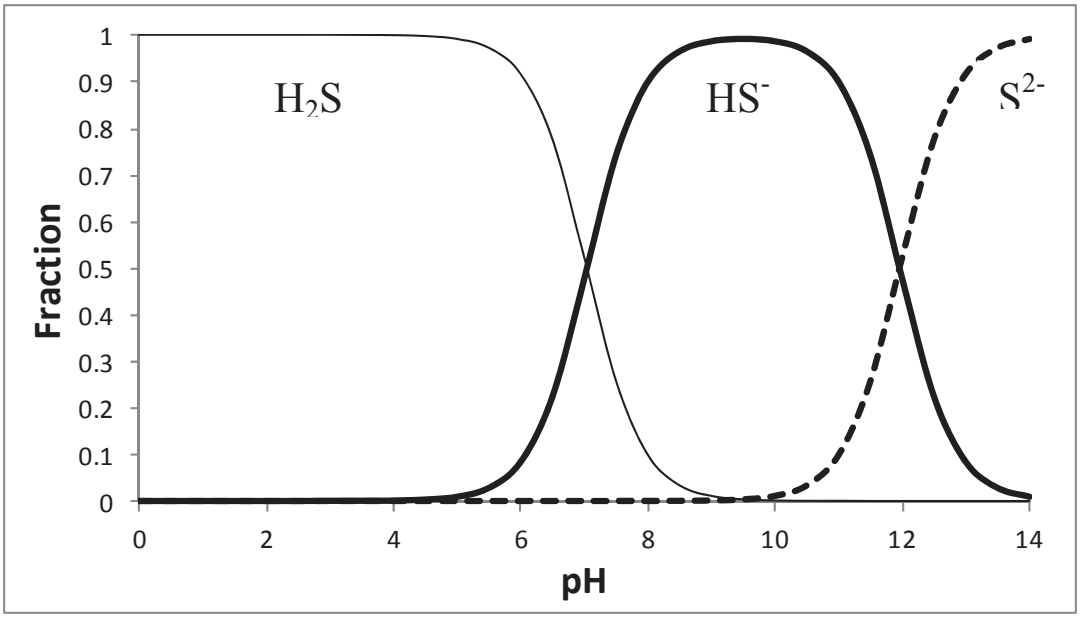

Figure 3.2 Fraction of Sulfide Species as a Function of Wastewater pH

The fractions of each sulfide species are calculated internally by H2SSIM and used to define the concentration of each dissociated form as a function of pH and total sulfide concentration. A critical use of these fractions is calculating the amount of sulfide available to volatilize to the atmosphere as H_2S (i.e., the volatilization term in Equation 3.2).

3.3 Generation of Sulfide in Wastewater

Sulfide can be generated in wastewater when conditions are favorable. These conditions include sufficient concentration of the reactants and an anoxic (i.e., dissolved oxygen is near zero) environment. A quantitative expression relating the sulfide generation rate to temperature, sulfate concentration, and oxygen concentration in pulp and paper wastewaters has been developed based on laboratory batch reactor experiments. The technical details of that study and subsequent equation development are reported in Appendix A.

The expression for sulfide generation in pulp and paper wastewaters is presented in Equation 3.11.

$$R_1 = k_{gen}\left(\frac{SO_4}{K_{SO_4} + SO_4}\right)\left(\frac{K_{DO}}{K_{DO} + DO}\right) \qquad \text{Equation 3.11}$$

Where: R_1 = Sulfide generation rate (M/L^3T)
SO_4 = Sulfate concentration (M/L^3)
DO = Dissolved oxygen concentration (M/L^3)
k_{gen} = Generation rate coefficient at 20 °C (M/L^3T)
K_{SO4} = Sulfate half saturation coefficient (M/L^3)
K_{DO} = Oxygen half saturation coefficient (M/L^3)

Equation 3.11 states that the rate of sulfide generation is proportional to an empirical rate coefficient and may be limited by low sulfate concentrations or the presence of oxygen.

The rate of sulfide generation is also affected by temperature. The optimal temperature for sulfate reducing bacteria has been reported as 25 to 35°C. The temperature correction should account for bacterial inhibition at temperatures greater than 35°C as in Equations 3.12 and 3.13.

When the wastewater temperature is 35°C or less, the model uses

$$k_{Temp} = k_{20}\theta^{Temp-20} \qquad \text{Equation 3.12}$$

Where θ = Temperature coefficient
k_{Temp} = Rate coefficient at actual temperature
k_{20} = rate coefficient at 20°
Temp = Temperature °C

When the wastewater temperature is greater than 35°C, the model uses

$$k_{Temp} = k_{20}\theta^{15} * \theta_2^{Temp-35} \qquad \text{Equation 3.13}$$

Where: θ_2 = Second temperature coefficient

The overall effect of Equations 3.12 and 3.13 is an increasing rate coefficient up to 35 °C. As temperatures increase further, the rate coefficient decreases. Details concerning Equation 3.13 can be found in NCASI (1985b).

3.4 Sulfide Oxidation

Sulfide is oxidized rapidly to sulfate and several intermediate sulfur species when exposed to aerobic conditions. A commonly used sulfide oxidation rate equation was found to adequately describe sulfide oxidation data from pulp and paper mill wastewaters (Palumbo, Brown, and Stratton 2010). This equation is presented here as Equation 3.14.

$$R_2 = k_{ox} S_{-II}{}^{m} (DO)^{n} \qquad \text{Equation 3.14}$$

Where: R_2 = Rate of sulfide oxidation (M/L^3T)
k_{ox} = Aerobic sulfide oxidation coefficient (T^{-1})
S_{-II} = Sulfide concentration (M/L)
DO = Dissolved oxygen concentration (M/L)
m = order of reaction with respect to sulfide (-)
n = order of reaction with respect to oxygen (-)

The sulfide oxidation rate changes as a function of pH. This change is represented in the model through a varying oxidation rate coefficient. The relationship between the rate coefficient and pH is shown in Equation 3.15. The derivation of Equation 3.15 is described in Appendix B.

$$k_{ox} = 7.16 * (1 - \exp(-0.84 * (pH - 6.15)) \qquad \text{Equation 3.15}$$

In Equation 3.15, it is assumed that the oxidation rate coefficient is zero below a pH value of 6.15.

When oxygen is absent, sulfide is more slowly oxidized in wastewaters. The rate of sulfide oxidation under anoxic conditions can be modeled using a modification of Equation 3.14. The development of this equation is presented in Appendix B.

$$R_2 = k_{anox} S_{-II}^{m} \qquad \text{Equation 3.16}$$

Where k_{anox} = Anoxic sulfide oxidation rate coefficient (T^{-1})

9. NOTES:
lb TRS (as H2S)/hr = 5.0e-03 lb TRS (as H2S)/T BLS x 1,129 T BLS/day x 1 day/24 hr = 0.23 lb TRS (as H2S)/hr

Emission Factors for references G, H, I and J converted from #/ADTP to #/T BLS assuming 3,500 # BLS/ADTP.
Actual production during Weston source test runs conducted on June 27, 2021
Maximum production is permitted production rate.
Total reduced sulfur emission are the sum of emissions of hydrogen sulfide, methyl mercaptan, dimethyl sulfide, and dimethyl disulfide.
Process variablity factors for metal compounds assume conversion of elemental metal to lowest state metal oxide, except HF.

_____loss due to mass transfer in conduit
run_____
The length of the run of conduit line is 426.14 m
(1398.097 ft.)
Flow of headspace gas in the conduit run_____10.523 L/s
the pressure gradient for the headspace flow
is -0.1206 gf/cm2
the headspace area of the sewer 3.233e+04 cm2
the headspace average velocity is 0.32553 cm/s.
the headspace recirculation velocity is 144.479 cm/s.
Flow of water in the conduit run_____935.575 L/s
the width of the surface is 120. cm.
the depth of the liquid is 30.618 cm. (12.054 in.)
the average depth of the liquid is 30.618 cm. (12.054
in.)
fraction full of liquid is 0.10206
the residence time of the liquid is 167.354 s.
The oil corrected aqueous HL is 3.085e+02 (y/x)
Wind Velocity 447. cm/sec (10.M.P.H.) (879.921 ft/min)
Velocity of headspace in sewer 0.32553 cm/sec (0.007282
M.P.H.) (0.6408ft/min)
kg is estimated as 0.001482 m/s. Model: 5
Modified J factor model is used for mass transfer.
the effective gas speed for the correlation is 144.479
cm/s.
the effective width for the correlation is 4.261e+
04cm.
the gas phase mass transfer coefficient is 6.1738e-06
gmol/cm2-s.
(kg) 1.4817e-03
m/s.
Trench model (Owens) for mass transfer in liquid phase.
the average liquid velocity is 254.634 cm/s.
the liquid depth in the underflow 30.618 cm.
the liquid phase mass transfer coefficient is
1.266e-03 gmol/cm2-s.
(kl)
2.2788e-04 m/s.
Overall mass transfer coefficient.
KL = 1 / (1 / kg / koc + 1 / kl) * 0.18
the corrected partition coefficient is 308.5 y/x at
one atm.
(KL) the overall liquid based mass transfer coefficient is
1.3689e-04 m/s.
Countercurrent flow model model is used for mass transfer.
the overall mass transfer coefficient is 1.369e-04
m/s.
the average depth of the liquid is 30.618 cm.
the ratio of the transfer coefficient to average depth
is 4.471e-04
the residence time of the liquid is 167.354 s.

3.2 Sulfide Dissociation

Inorganic, free sulfide can exist in three forms, the concentrations of which depend upon the wastewater pH. H2SSIM calculates the effect of pH on the predominant sulfide form present in the wastewater. This calculation is significant because only H_2S is a volatile form of sulfide.

At the near neutral pH conditions encountered in most wastewaters undergoing biological treatment, hydrogen sulfide dissociates to yield a hydrogen ion and hydrogen sulfide ion (Equation 3.4).

$$H_2S \leftrightarrow H^+ + HS^- \qquad \text{Equation 3.4}$$

At very high pH levels, the hydrogen sulfide ion can dissociate again to a hydrogen ion and sulfur ion (Equation 3.5).

$$HS^- \leftrightarrow H^+ + S^{2-} \qquad \text{Equation 3.5}$$

When the reaction is considered to be at equilibrium, the reaction and concentration products can be defined by Equations 3.6 and 3.7.

$$K_1 = \frac{[H^+][HS^-]}{H_2S} \qquad \text{Equation 3.6}$$

$$K_2 = \frac{[H^+][S^{2-}]}{HS^-} \qquad \text{Equation 3.7}$$

If the reactions represented in Equations 3.4 and 3.5 are considered to occur much faster than the other processes in the overall mass balance equation, a local equilibrium holds (Chapra 1997) and the sulfide dissociation reaction can be solved outside of the sulfide mass balance equation.

If a local equilibrium exists for sulfide dissociation, the fraction of total sulfide that exists as each species at the specified pH can be calculated (Equations 3.8 through 3.10).

$$F_{HS} = \frac{K_1[H^+]}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.8}$$

$$F_{H_2S} = \frac{K_1K_2[H^+]^2}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.9}$$

$$F_S = \frac{1}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.10}$$

Where: F_{HS} = Fraction of total sulfide as HS^-

F_{H2S} = Fraction of total sulfide as H_2S

F_S = Fraction of total sulfide as S^{2-}

The fraction of each sulfide species calculated by these equations with pKa1 = 7.04 and pKa = 11.96 is shown in Figure 3.2.

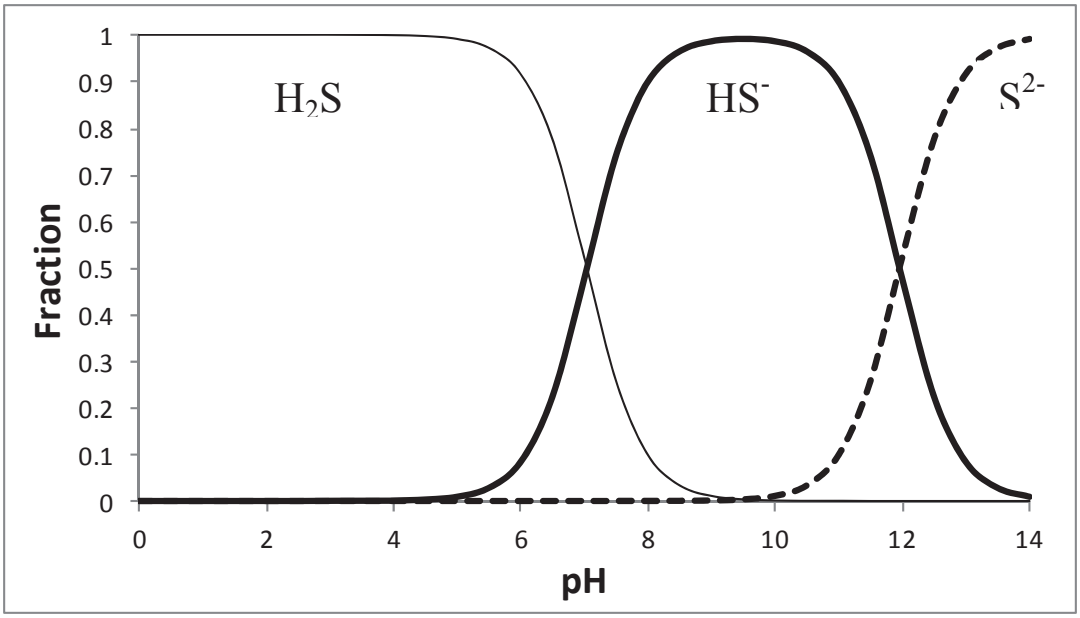

Figure 3.2 Fraction of Sulfide Species as a Function of Wastewater pH

The fractions of each sulfide species are calculated internally by H2SSIM and used to define the concentration of each dissociated form as a function of pH and total sulfide concentration. A critical use of these fractions is calculating the amount of sulfide available to volatilize to the atmosphere as H_2S (i.e., the volatilization term in Equation 3.2).

3.3 Generation of Sulfide in Wastewater

Sulfide can be generated in wastewater when conditions are favorable. These conditions include sufficient concentration of the reactants and an anoxic (i.e., dissolved oxygen is near zero) environment. A quantitative expression relating the sulfide generation rate to temperature, sulfate concentration, and oxygen concentration in pulp and paper wastewaters has been developed based on laboratory batch reactor experiments. The technical details of that study and subsequent equation development are reported in Appendix A.

The expression for sulfide generation in pulp and paper wastewaters is presented in Equation 3.11.

$$R_1 = k_{gen}\left(\frac{SO_4}{K_{SO_4} + SO_4}\right)\left(\frac{K_{DO}}{K_{DO} + DO}\right) \qquad \text{Equation 3.11}$$

Where: R_1 = Sulfide generation rate (M/L^3T)
SO_4 = Sulfate concentration (M/L^3)
DO = Dissolved oxygen concentration (M/L^3)
k_{gen} = Generation rate coefficient at 20 °C (M/L^3T)
K_{SO4} = Sulfate half saturation coefficient (M/L^3)
K_{DO} = Oxygen half saturation coefficient (M/L^3)

Equation 3.11 states that the rate of sulfide generation is proportional to an empirical rate coefficient and may be limited by low sulfate concentrations or the presence of oxygen.

The rate of sulfide generation is also affected by temperature. The optimal temperature for sulfate reducing bacteria has been reported as 25 to 35°C. The temperature correction should account for bacterial inhibition at temperatures greater than 35°C as in Equations 3.12 and 3.13.

When the wastewater temperature is 35°C or less, the model uses

$$k_{\mathrm{Temp}} = k_{20}\theta^{Temp-20} \qquad \text{Equation 3.12}$$

Where θ = Temperature coefficient
k_{Temp} = Rate coefficient at actual temperature
k_{20} = rate coefficient at 20°
Temp = Temperature °C

When the wastewater temperature is greater than 35°C, the model uses

$$k_{Temp} = k_{20}\theta^{15} * \theta_2^{Temp-35} \qquad \text{Equation 3.13}$$

Where: θ_2 = Second temperature coefficient

The overall effect of Equations 3.12 and 3.13 is an increasing rate coefficient up to 35 °C. As temperatures increase further, the rate coefficient decreases. Details concerning Equation 3.13 can be found in NCASI (1985b).

3.4 Sulfide Oxidation

Sulfide is oxidized rapidly to sulfate and several intermediate sulfur species when exposed to aerobic conditions. A commonly used sulfide oxidation rate equation was found to adequately describe sulfide oxidation data from pulp and paper mill wastewaters (Palumbo, Brown, and Stratton 2010). This equation is presented here as Equation 3.14.

$$R_2 = k_{ox} S_{-II}{}^{m} (DO)^{n} \qquad \text{Equation 3.14}$$

Where: R_2 = Rate of sulfide oxidation (M/L^3T)
k_{ox} = Aerobic sulfide oxidation coefficient (T^{-1})
S_{-II} = Sulfide concentration (M/L)
DO = Dissolved oxygen concentration (M/L)
m = order of reaction with respect to sulfide (-)
n = order of reaction with respect to oxygen (-)

The sulfide oxidation rate changes as a function of pH. This change is represented in the model through a varying oxidation rate coefficient. The relationship between the rate coefficient and pH is shown in Equation 3.15. The derivation of Equation 3.15 is described in Appendix B.

$$k_{ox} = 7.16 * (1 - \exp(-0.84 * (pH - 6.15)) \qquad \text{Equation 3.15}$$

In Equation 3.15, it is assumed that the oxidation rate coefficient is zero below a pH value of 6.15.

When oxygen is absent, sulfide is more slowly oxidized in wastewaters. The rate of sulfide oxidation under anoxic conditions can be modeled using a modification of Equation 3.14. The development of this equation is presented in Appendix B.

$$R_2 = k_{anox} S_{-II}^{m} \qquad \text{Equation 3.16}$$

Where k_{anox} = Anoxic sulfide oxidation rate coefficient (T^{-1})

3.2 Sulfide Dissociation

Inorganic, free sulfide can exist in three forms, the concentrations of which depend upon the wastewater pH. H2SSIM calculates the effect of pH on the predominant sulfide form present in the wastewater. This calculation is significant because only H_2S is a volatile form of sulfide.

At the near neutral pH conditions encountered in most wastewaters undergoing biological treatment, hydrogen sulfide dissociates to yield a hydrogen ion and hydrogen sulfide ion (Equation 3.4).

$$H_2S \leftrightarrow H^+ + HS^- \qquad \text{Equation 3.4}$$

At very high pH levels, the hydrogen sulfide ion can dissociate again to a hydrogen ion and sulfur ion (Equation 3.5).

$$HS^- \leftrightarrow H^+ + S^{2-} \qquad \text{Equation 3.5}$$

When the reaction is considered to be at equilibrium, the reaction and concentration products can be defined by Equations 3.6 and 3.7.

$$K_1 = \frac{[H^+][HS^-]}{H_2S} \qquad \text{Equation 3.6}$$

$$K_2 = \frac{[H^+][S^{2-}]}{HS^-} \qquad \text{Equation 3.7}$$

If the reactions represented in Equations 3.4 and 3.5 are considered to occur much faster than the other processes in the overall mass balance equation, a local equilibrium holds (Chapra 1997) and the sulfide dissociation reaction can be solved outside of the sulfide mass balance equation.

If a local equilibrium exists for sulfide dissociation, the fraction of total sulfide that exists as each species at the specified pH can be calculated (Equations 3.8 through 3.10).

$$F_{HS} = \frac{K_1[H^+]}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.8}$$

$$F_{H_2S} = \frac{K_1K_2[H^+]^2}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.9}$$

$$F_S = \frac{1}{1+K_1[H^+]+K_1K_2[H^+]^2} \qquad \text{Equation 3.10}$$

Where: F_{HS} = Fraction of total sulfide as HS^-

F_{H2S} = Fraction of total sulfide as H_2S

F_S = Fraction of total sulfide as S^{2-}

The fraction of each sulfide species calculated by these equations with pKa1 = 7.04 and pKa = 11.96 is shown in Figure 3.2.

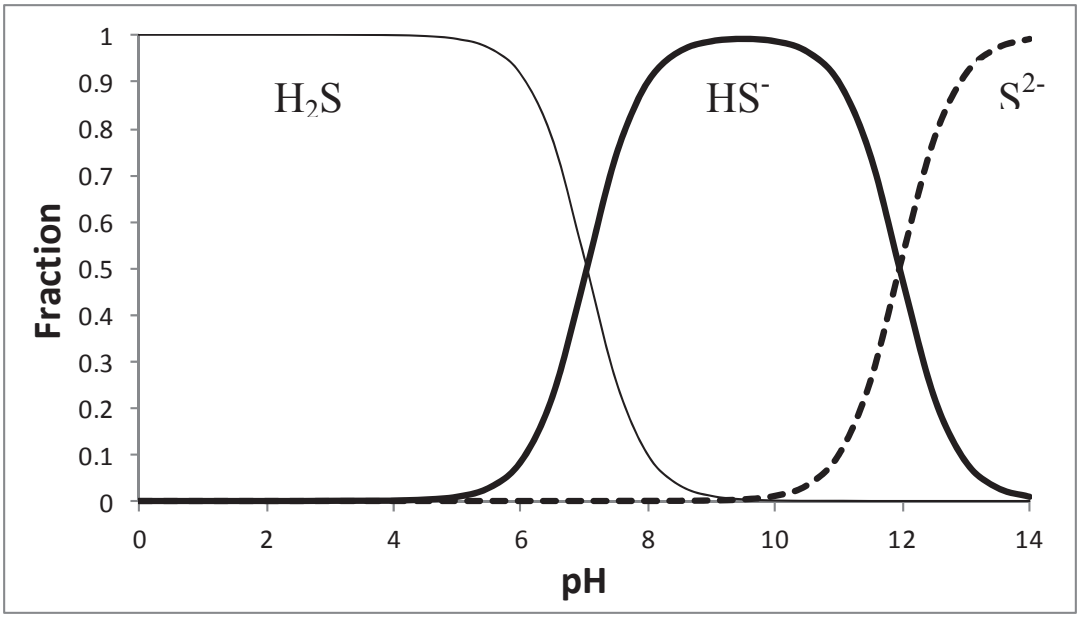

Figure 3.2 Fraction of Sulfide Species as a Function of Wastewater pH

The fractions of each sulfide species are calculated internally by H2SSIM and used to define the concentration of each dissociated form as a function of pH and total sulfide concentration. A critical use of these fractions is calculating the amount of sulfide available to volatilize to the atmosphere as H_2S (i.e., the volatilization term in Equation 3.2).

3.3 Generation of Sulfide in Wastewater

Sulfide can be generated in wastewater when conditions are favorable. These conditions include sufficient concentration of the reactants and an anoxic (i.e., dissolved oxygen is near zero) environment. A quantitative expression relating the sulfide generation rate to temperature, sulfate concentration, and oxygen concentration in pulp and paper wastewaters has been developed based on laboratory batch reactor experiments. The technical details of that study and subsequent equation development are reported in Appendix A.

The expression for sulfide generation in pulp and paper wastewaters is presented in Equation 3.11.

$$R_1 = k_{gen}\left(\frac{SO_4}{K_{SO_4} + SO_4}\right)\left(\frac{K_{DO}}{K_{DO} + DO}\right) \qquad \text{Equation 3.11}$$

Where: R_1 = Sulfide generation rate (M/L^3T)
SO_4 = Sulfate concentration (M/L^3)
DO = Dissolved oxygen concentration (M/L^3)
k_{gen} = Generation rate coefficient at 20 °C (M/L^3T)
K_{SO4} = Sulfate half saturation coefficient (M/L^3)
K_{DO} = Oxygen half saturation coefficient (M/L^3)

Equation 3.11 states that the rate of sulfide generation is proportional to an empirical rate coefficient and may be limited by low sulfate concentrations or the presence of oxygen.

The rate of sulfide generation is also affected by temperature. The optimal temperature for sulfate reducing bacteria has been reported as 25 to 35°C. The temperature correction should account for bacterial inhibition at temperatures greater than 35°C as in Equations 3.12 and 3.13.

When the wastewater temperature is 35°C or less, the model uses

$$k_{\mathrm{Temp}} = k_{20}\theta^{Temp-20} \qquad \text{Equation 3.12}$$

Where θ = Temperature coefficient
k_{Temp} = Rate coefficient at actual temperature
k_{20} = rate coefficient at 20°
Temp = Temperature °C

When the wastewater temperature is greater than 35°C, the model uses

$$k_{Temp} = k_{20}\theta^{15} * \theta_2^{Temp-35} \qquad \text{Equation 3.13}$$

Where: θ_2 = Second temperature coefficient

The overall effect of Equations 3.12 and 3.13 is an increasing rate coefficient up to 35 °C. As temperatures increase further, the rate coefficient decreases. Details concerning Equation 3.13 can be found in NCASI (1985b).

3.4 Sulfide Oxidation

Sulfide is oxidized rapidly to sulfate and several intermediate sulfur species when exposed to aerobic conditions. A commonly used sulfide oxidation rate equation was found to adequately describe sulfide oxidation data from pulp and paper mill wastewaters (Palumbo, Brown, and Stratton 2010). This equation is presented here as Equation 3.14.

$$R_2 = k_{ox} S_{-II}{}^{m} (DO)^{n} \qquad \text{Equation 3.14}$$

Where: R_2 = Rate of sulfide oxidation (M/L^3T)
k_{ox} = Aerobic sulfide oxidation coefficient (T^{-1})
S_{-II} = Sulfide concentration (M/L)
DO = Dissolved oxygen concentration (M/L)
m = order of reaction with respect to sulfide (-)
n = order of reaction with respect to oxygen (-)

The sulfide oxidation rate changes as a function of pH. This change is represented in the model through a varying oxidation rate coefficient. The relationship between the rate coefficient and pH is shown in Equation 3.15. The derivation of Equation 3.15 is described in Appendix B.

$$k_{ox} = 7.16 * (1 - \exp(-0.84 * (pH - 6.15)) \qquad \text{Equation 3.15}$$

In Equation 3.15, it is assumed that the oxidation rate coefficient is zero below a pH value of 6.15.

When oxygen is absent, sulfide is more slowly oxidized in wastewaters. The rate of sulfide oxidation under anoxic conditions can be modeled using a modification of Equation 3.14. The development of this equation is presented in Appendix B.

$$R_2 = k_{anox} S_{-II}^{m} \qquad \text{Equation 3.16}$$

Where k_{anox} = Anoxic sulfide oxidation rate coefficient (T^{-1})

      Compound flow rate from inlet water is 0.003822 g/s.
      Compound flow rate from inlet vent is 0. g/s.
      Compound flow rate from inlet duct is 0. g/s.
      Submerged aeration rate from inlet vent is 0. m3/s.
      Total submerged aeration is 0. m3/s.
      The residence time in the unit is 0.28269 hr.
      ____Biomass production_______________
          The biomass production rate is 0.mg/hr. (0. mg/L)
          The fraction dissolved solids converted is 0. .
          The estimated biomass exit concentration is 0. mg/L.
      ________Quiescent wind shear surface___Springer_
      Springer correlation does not apply, use Mackay and Yeun
(1983).
      The friction velocity is 13.347cm/s.
      The Schmidt number is 977.316.
      kl is estimated as 6.485e-06 m/s.
      kg is estimated as 0.007619 m/s.  Model: 2
      kg is estimated as 0.007619 m/s.  Model: 2
      The Schmidt number is 1.75559.
      The friction velocity is 31.28 m/s
      kg is estimated as 0.010777 m/s.  Model: 3
      ________Agitated surface___________________
      The rotation speed is 125.654 radians per second.
      The rotation factor NRW is 2.052e+06.
      The power number NPR is 7.881e-04.
      The rotation factor NFR is 797.027.
      kg (agitated)is estimated as 0.11393 m/s.
      kl (agitated)is estimated as 0.044043 m/s.
          The specified and growth biomass is 0.3 g/L.
       The effective KL (surface + diffused air) is 0.001172 m/s.
```

The effective stripping time (surface + diffused air) is 65.412 minutes. (1.09019 hrs.)
The pump mixing time is 5 x the pumping recirculaion time, 0. min.
The ratio of the mixing to the striping (surface + diffused air) is 0.
The mean residence time is 16.961 min. (0.28269 hr.)
The ratio of the pump mixing to the residence time is 0.

      kg is estimated as 0.018298 m/s.  Model: 3
      ________Agitated surface___________________
      The rotation speed is 125.654 radians per second.
      The rotation factor NRW is 3.011e+06.
      The power number NPR is 6.188e-05.
      The rotation factor NFR is 965.508.
      kg (agitated)is estimated as 0.092361 m/s.
      kl (agitated)is estimated as 0.020512 m/s.
          The specified and growth biomass is 2. g/L.
       The effective KL (surface + diffused air) is 0.008222 m/s.
       The effective stripping time (surface + diffused air) is
9.325 minutes. (0.15541 hrs.)
       The pump mixing time is 5 x the pumping recirculaion time,
0. min.
       The ratio of the mixing to the striping (surface +
diffused air) is 0.
       The mean residence time is 13.463 min. (0.22438 hr.)
       The ratio of the pump mixing to the residence time is 0.
         KG aerated (m/s)                        0.094092
         KL aerated (m/s)                        0.020512

Table A-40
Flow and Concentration Inputs - Water9
New Indy Catawba - Catawba, SC

	Flow[a] (l/s)	H_2S Concentration (ppm)	DMDS Concentration (ppm)	DMS Concentration (ppm)	MMC Concentration (ppm)
Clarifier to Ditch #1[b]	935.58		0.036	0.130	1.09E-03
Ditch #0 to Ditch #1[b][c]	935.58	0.020			
ASB	950.49	1.35	0.14	0.13	0.07
Holding Pond	950.49	8.13E-03	1.95E-03	4.92E-03	9.91E-04
Post-ASB[d]	1009.15	1.71E-03	4.00E-03	1.61E-03	5.02E-04

[a] Includes a 10% evaporation factor.

[b] Concentrations of TRS compounds in Mill Sewer were backcalculated using the fraction removed calculated in Water9 and the ASB influent concentration.

[c] The Primary Clarifier was not modeled for H2S in Water9. A separate model run starting with Ditch #0 was used to estimate H2S emissions rates from Ditch #0 and Ditch #1

[d] Post-ASB flow represents actual discharge between 7/9-11/2021
