Bureau of Water  
Department of Health and Environmental Control  
2600 Bull Street  
Columbia, South Carolina 29201

Subject: South Carolina's 2020 and 2022 303(d) List Submittal

Dear Ms. Jennifer Hughes:

The U.S. Environmental Protection Agency, Region 4 has completed its review of South Carolina's Final 2020 and 2022 Clean Water Act section 303(d) List of water quality limited segments (WQLS). With the exceptions noted in the following paragraph, the EPA has determined that each of the WQLSs still requiring total maximum daily loads, identified on the state's List, meets the requirements of the Clean Water Act (CWA) section 303(d) and its implementing regulations at 40 C.F.R. section 130.7. The EPA is partially approving and partially disapproving the State's 2020 and 2022 303(d) Lists.

The EPA disapproves the state's decision to not list WQLSs when a biological assessment of macroinvertebrates scores over a certain amount, but other readily available data indicate impairment for one or more parameters. The state's decision is inconsistent with Section 303(d) of the CWA and the implementing regulations pursuant to 40 C.F.R § 130.7, and the EPA is identifying three WQLSs for inclusion on the List. Enclosed for your information is the accompanying decision document for this partial approval action.

The EPA will issue a public notice providing for a 30-day public comment period on these additions to South Carolina's List. After considering and responding to comments received, the EPA may make revisions as appropriate and then will transmit the final listings to South Carolina.

If you have questions concerning this matter, please feel free to contact me at (404) 562-9345 or Ms. Viola Reynolds, Monitoring, Assessment, Listing, and TMDL Section Chief at (404) 562-8455.

Sincerely,

**DENISSE DIAZ**

## **Part I: Listing of Impaired Waters**

### **Introduction**

The South Carolina Department of Health and Environmental Control (SCDHEC or the Department) developed this priority list of waters pursuant to Section §303(d) of the Federal Clean Water Act (CWA) and Federal Regulation 40 CFR 130.7 last revised in 1992. The listing identifies South Carolina waters that do not currently meet State water quality standards after application of required controls for point and nonpoint source pollutants. Updated use attainment determinations were made using water quality data collected from 2014 through 2018 for the 2020 assessment and 2016 through 2020 for the 2022 assessment. The classified uses of waters and a number of other factors were considered in establishing priorities and targets. The 2022 list will be used to consider waters for further investigation, additional monitoring, and water quality improvement measures, including Total Maximum Daily Loads (TMDLs).

Over the past three decades, impacts from point sources to waters have been substantially reduced through point source controls achieved via National Pollutant Discharge Elimination System (NPDES) permits. Since 1990, steady progress in controlling nonpoint source impacts has also been made through implementation of South Carolina's Nonpoint Source Management Program. In conjunction with TMDL development and implementation, the continued expansion and promotion of these and other state and local water quality improvement programs are expected to be effective in reducing the number of impaired waters.

In compliance with 40 CFR 25.4(c), the Department, beginning June 30, 2022, commenced a minimum 30-day public notice to ensure broad notice of the Department's intent to update its list of impaired waters. The 2020 and 2022 Combined §303(d) List of Impaired Waters was made available for public comment until 5:00pm August 1, 2022. This list also identifies specific waters and pollutants targeted for TMDLs or alternative restoration plans. Public input was solicited regarding the draft listing, methodology and restoration priorities. The Department provided direct notice by email to interested parties, industries, private individuals, universities, research groups, federal agencies, other state agencies, and the United State Environmental Protection Agency (the USEPA, EPA). The Department has also posted the public notice and the draft list on its website. A copy of the notice of availability of the draft listing is provided in Appendix G. A summary of comments and responses has been provided in Appendix I.

Additional public input was solicited through regular interactions between Department staff, interested members of the public, and other resource agencies. Department staff have regular interaction with stakeholders throughout each of the eight major river basins during stakeholder meetings, educational events, and individual contact sessions. Through this process valuable information is received which supports list development and TMDL prioritization. Public participation will continue to occur throughout the §303(d) process.

Part II of the Integrated Report (IR) submittal makes use of the identical data and assessment methodology that follows; therefore, no separate consideration of the 305(b) report is required for these listings. In consideration of the USEPA's Assessment, TMDL Tracking and

Implementation System (ATTAINS) all §303(d) listed assessment units will be included in South Carolina's portion of that repository for this listing cycle.

### **Methodology for Delisting Waters from the §303(d) List**

The Department reviewed the final 2018 §303(d) list as the starting point for the development of the 2020 and 2022 combined §303(d) list. All waters on the 2018 §303(d) listing were evaluated for appropriate inclusion on the 2020 §303(d) list as defined in 40 CFR 130.2(j). Similarly, the 2022 list made use of the 2020 list as a basis for development.

Good cause for delisting of waters from the 2018 §303(d) list includes the following: 1) the most recent data and information indicate that water quality standards are being met (standard attainment), 2) a TMDL has been developed and approved, and 3) the listing analysis conducted for the 2018 §303(d) list contained errors (e.g., laboratory reporting error, QA/QC requirements not met, legal ruling). Any one or combination of these reasons may be used by the Department to delist waters.

Waters listed for "BIO" (biological impairment) on the 2018 §303(d) list have been removed for BIO if a pollutant responsible for the impairment has been identified. These waters remain on the combined 2020 and 2022 §303(d) list for that pollutant and TMDLs will be developed for the pollutant of concern (not the biological impairment). Other waters have been removed from the list when biological data have shown full use support despite other chemical and/or physical standards excursions.

Waters that appeared on the 2018 §303(d) list that do not meet the above justifications for delisting remain on the 2020 list of impaired waters. It is also important to note that no water can be delisted due to standard attainment unless there are recent data that have been considered during the relevant assessment window as previously described.

The same methodology was used in delisting waters from the 2020 list.

### **Methodology for Listing: the South Carolina 2020 and 2022 §303(d) Lists**

In accordance with federal guidelines, the Department evaluated waters identified as impaired for appropriate inclusion on the 2020 and 2022 §303(d) lists. The Department has an extensive, fixed ambient surface water monitoring network throughout South Carolina with more than 240 stations. The SCDHEC monitoring effort also includes over 450 shellfish sanitation stations, over 100 aquatic macroinvertebrate stations, approximately 200 fish tissue stations, and over 100 beach monitoring stations. Since 2002, a set of probability-based, or "random" sampling stations has been added to the Department's water quality monitoring strategy. The use of this sampling methodology enhances the ability to make statistically valid inferences about large watershed areas based on a relatively few sampling stations. In collaboration with the USEPA, numerous random stations are incorporated in the Department's monitoring program each year. SCDHEC's total monitoring effort for the assessment used for these §303(d) lists included data collected at over 1800 stations as described above. SCDHEC's monitoring strategy is available online:

<https://scdhec.gov/environment/your-water-coast/how-dhec-measures-surface-water-quality>

The cyclical nature of the Department's permitting, monitoring, and data analysis results in a dynamic §303(d) listing. As new waters are monitored, new impaired sites may be discovered which require listing. As a result of increased monitoring locations, some waters have been added to the 2020 and 2022 §303(d) lists. In compliance with water quality standards (SC Regulation 61-68), waters with standards excursions attributable solely to natural conditions are not included on South Carolina's §303(d) list.

The Department has considered the South Carolina Short List of waters which was prepared in 1989 pursuant to Section §304(l) of the CWA. This "one-time" § 304(l) Short List identified waters where the State did not expect applicable water quality standards to be achieved after technology-based requirements had been met due entirely or substantially to point source discharges of §307(a) toxics. The §304(l) Short List was considered as required, but not used for development of the 2020 and 2022 §303(d) lists since those water quality problems have already been addressed. If current data and information on water quality for the specific water bodies included on the 1989 §304(l) list ever indicate less than full support of uses, they will be added to the §303(d) list.

### **Sources of Data**

For this listing cycle, the Department actively solicited data and information for the specific purpose of §303(d) listing. The Department has a standing data solicitation year round which is available online:

<https://scdhec.gov/south-carolina-303d-list-impaired-waters-tmdl-limits-contaminants#2>

In addition, solicitation notices were directly emailed to institutions known to collect environmental data (e.g., research universities, power utilities, other state and federal resource agencies). Copies of the solicitation notices are provided in Appendix F. Traditionally multiple sources of information have been considered when compiling the South Carolina §303(d) list. The Department has reviewed an assemblage of sources of readily available data and information, including federal and state resource agencies, 319 project grantees, and electric utilities. SCDHEC also considered data from North Carolina and Georgia with common water bodies.

The following data sources were considered for the 2020 and 2022 §303(d) listings:

### **SCDHEC: Environmental Affairs**

- Physical, chemical, and bacterial data from surface water monitoring sites
- Data collected at shellfish harvesting monitoring sites
- Fish tissue monitoring data
- Stream macroinvertebrate assessments
- Lake water quality assessment data (§314)
- Environmental Surveillance Oversight Program (Savannah River Site)
- State Nonpoint Source Management Plan (§319)
- Beach Monitoring Data

- Special studies

### **Other biological data**

- United States Fish and Wildlife Service
- South Carolina Department of Natural Resources

### **Other chemical and bacteriological data**

- Santee Cooper Public Service Authority
- Outside data collected in accordance with a SCDHEC-approved Quality Assurance Project Plan (QAPP) for the purpose of §303(d) listing consideration.

The Department's Quality Assurance Management Plan (QAMP) has been approved by the USEPA as part of its requirements under Section 106 of the CWA. All data and information sources used for the 2020 and 2022 §303(d) lists were reviewed in accordance with the QAMP. All data and information used were readily accessible and met the Department's criteria for quality assurance. A checklist of QA/QC considerations used by the Department can be found at: <https://scdhec.gov/quality-assurance-plans>

### **Determination of Attainment of Classified Uses**

Physical, chemical, and biological data were evaluated, as described below, to determine if water quality met the criteria established to protect the State classified uses as promulgated in Regulation 61-68, Water Classifications & Standards. These regulations are subject to a triennial review as required in section 303 of the Clean Water Act. To determine the appropriate classified uses and water quality criteria for specific waters and locations, refer to Regulation 61-69, Classified Waters, in conjunction with Regulation 61-68: <https://scdhec.gov/BOW/water-regulations-standards>

Most data were assessed based on a five-year assessment period. Metals data for aquatic life use support and fecal coliform data for shellfish harvesting use support were assessed based on a three-year assessment period. Trend analysis was considered using up to 15 years of data. Less current data may still be the basis for listing previously listed sites where no new data was collected.

The use attainment decision process follows the basic approach set forth in the USEPA guidance for the preparation of The State of South Carolina's 2020 and 2022 Integrated Report (IR) Part II: *Section §305(b) Assessment and Reporting*.

A more detailed discussion of SCDHEC's use attainment determination methodology is contained in Appendix H.

### **Aquatic Life Use Support**

One important goal of the Clean Water Act and state standards is to maintain the quality of surface waters to provide for the survival and propagation of a balanced indigenous aquatic community of fauna and flora. Aquatic life use support is assessed by comparing important water

quality characteristics to criteria. Support of aquatic life uses is determined based on the percentage of criteria excursions and, where data are available, the composition and functional integrity of the biological community. Among the parameters assessed are dissolved oxygen, pH, toxicants (priority pollutants, heavy metals, ammonia), nutrients, and turbidity. If the conclusion for any one parameter is that the criterion is not met, then it is concluded that aquatic life use is not supported and the location is listed as impaired.

Several waters have been given waterbody-specific criteria for pH and dissolved oxygen (DO), which reflect natural conditions. To determine the appropriate criteria and classified uses for specific waters and locations, please refer to Regulation 61-68, Water Classifications and Standards, and Regulation 61-69, Classified Waters.

For DO and pH, if 10 percent or less of the samples contravenes the appropriate criterion, then the criterion is said to be fully supported. A percentage of criterion excursions greater than 10% indicates impairment and results in inclusion on the current §303(d) lists, unless excursions are due to natural conditions as described further below.

For any individual toxicant pollutant (heavy metals, priority pollutants, chlorine, ammonia), if the appropriate acute and/or chronic aquatic life criterion is exceeded more than once in three years (2016 through 2018 for the 2020 assessment or 2018 through 2020 for the 2022 assessment), the location is listed as impaired for the pollutant of concern. The Department also used discretion, considering factors other than excursion magnitude and frequency, to determine the impairment status due to toxicants (See Appendix H for additional detail).

For turbidity in all lakes, and for waters with numeric total phosphorus, total nitrogen, and/or chlorophyll-a criteria, if the appropriate criterion is exceeded in more than 25 percent of the samples, the criterion is not supported and the location is listed as impaired. For waters with contraventions of standards between 10% and 25%, further site-specific evaluation, including but not limited to consideration of prior listings, is necessary to determine if standards violations indicate actual aquatic life use impairment or if water quality standards are fully attained. For turbidity in streams, if the appropriate criterion is exceeded in more than 10 percent of the samples, the criterion is not supported and the location is listed as impaired.

For aquatic life uses, the goal of the standards is the protection of a balanced indigenous aquatic community. Therefore, biological data are generally considered as the deciding factor, regardless of chemical conditions. South Carolina Regulation 61-68 Section E. 14 d. (2) states that if the ambient concentration is higher than the numeric criterion for toxic pollutants, the criterion is not considered violated if biological monitoring has demonstrated that the in-stream indigenous biological community is not adversely impacted. Section E. 15 a. states that biological assessment methods may be employed in other appropriate situations to assess and ensure the maintenance of a balanced indigenous aquatic community. These sections from the State water quality standards regulation provide the Department with discretion in data assessment for compliance with water quality standards. There are some waters where the Department has gathered both chemical and biological data. After evaluation of the data, the Department has in some instances made the decision that the aquatic life use is fully supported based upon the

biological data. As always when there is conflicting data, the Department will continue to carefully monitor these waters to ensure that all applicable water quality standards are met.

In the assessment of biological data, aquatic and semi-aquatic macroinvertebrates are identified to the lowest practical taxonomic level depending on the condition and maturity of specimens collected. The EPT Index (Ephemeroptera, Plecoptera, Trichoptera) and the North Carolina Biotic Index (BI) are the main indices used in analyzing macroinvertebrate data. A habitat evaluation is conducted at each biological monitoring site and is considered in the aquatic community assessment score.

As stated in Appendix H, certain state waters, such as blackwater systems in the Sandhills and Coastal Plain are frequently characterized by naturally low pH and DO concentrations, as are many tidally influenced systems along the coast. The Department used biological community data as a factor in determining whether pH and DO excursions represent natural conditions. On a case-by-case basis, departmental staff also considered other factors such as land use and critical hydrology in assessing use attainment at individual locations where natural conditions were potentially involved. The Department does not believe that it is appropriate to develop TMDLs or alternative restoration plans for these sites, per Regulation 61-68 Section C. 9.

### **Recreational Use Support**

The degree to which the swimmable goal of the Clean Water Act is attained (Recreational Use Support) is based on the concentration of pathogen indicator bacteria present in a waterbody. Standards for primary contact recreation were derived from public health data that estimate the potential risks to humans of contracting waterborne illnesses after swimming due to exposure to sewage-related pathogens. These water quality standards are promulgated in Regulation 61-68, Water Classifications & Standards.

### **Freshwater**

South Carolina's water quality standard (WQS) for primary contact recreational use in freshwaters (Classes FW, TN, TPGT, and TPT) is *Escherichia coli*:

“Not to exceed a geometric mean of 126/100 ml based on at least four samples collected from a given sampling site over a 30 day period, nor shall a single sample maximum exceed 349/100 ml”.

This standard is protective of primary contact recreational use; therefore, secondary contact recreational use is also protected.

For development of 2020 and 2022 Combined §303(d) list, any site determined to be impaired due to freshwater recreational use will be listed for *Escherichia coli* (*E. coli*). This includes sites where no new pathogen indicator data have been assessed but are being carried over as impaired from the previous §303(d) listing cycle.

Where sufficient data are collected to evaluate against the geometric mean component of the *E. coli* standard, a percentage of criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list. In most cases,

insufficient data are collected to evaluate against the geometric mean component of the standard as prescribed in R. 61-68; therefore, evaluation against the single sample maximum (SSM) criterion is necessary. A percentage of SSM criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list.

### **Tidal Saltwater**

South Carolina's WQS for primary contact recreational use in tidal saltwaters (Classes SA, SB and SFH) is Enterococci:

“Not to exceed a geometric mean of 35/100 ml based on at least four samples collected from a given sampling site over a 30 day period, nor shall a single sample maximum exceed 104/100 ml”.

For development of the combined 2020 and 2022 §303(d) list, any tidal saltwater site determined to be impaired for recreational use will be listed for Enterococci. This includes sites where no new pathogen indicator data were assessed but are being carried over as impaired from the previous §303(d) listing cycle. Before 2020 the SSM for Enterococci in Class SB waters was 501/100 ml. All SB sites assessed for recreational use for the combined 2020 and 2022 §303(d) list were assessed using the current water quality standard of 104/100 ml.

Where sufficient data are collected to evaluate against the geometric mean component of the Enterococci standard, a percentage of criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list. In most cases, insufficient data are collected to evaluate against the geometric mean component of the standard as prescribed in R. 61-68; therefore, evaluation against the single sample maximum (SSM) criterion is necessary. A percentage of SSM criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list.

Beach advisories may be issued for a period in which elevated Enterococci levels persist. Advisories may be cancelled when subsequent monitoring results demonstrate that the Enterococci standard is attained. Advisories and targeted sampling events for the purposes of cancelling advisories do not warrant listing for §303(d) purposes. Instead, an approach was developed in accordance with the USEPA guidance and South Carolina Regulations 61-68. Details may be obtained here:

<http://www.scdhec.gov/HomeAndEnvironment/Pollution/DHECPollutionMonitoringServices/BeachMonitoring>

### **Fish and Shellfish Consumption**

Fish consumption use support is determined by the occurrence of advisories limiting human consumption of fish for a given waterbody. These advisories are based on the occurrence of mercury or PCB in fish tissue. The presence of an advisory indicates nonsupport of the use and the sampling site is included on the §303(d) list of impaired waters.

Shellfish use support is determined by the harvesting status for a given shellfish harvesting area.

Based on an assessment against the appropriate water quality standard, elevated fecal coliform bacteria levels and/or a classification which restricts shellfish harvesting in a designated harvesting area indicates nonsupport of the use and the location may be included on the §303(d) list of impaired waters. The latest shellfish sanitation report data assessments available were used during development of the 2020 and 2022 §303(d) lists. Note that the shellfish harvesting use should not be confused with the recreational use which is assessed using E. coli or Enterococci.

Fish consumption advisories and shellfish sanitation information are updated periodically. Background information and the most up-to-date fish consumption advisories are available here: <https://www.scdhec.gov/food-safety/food-monitoring-advisories/fish-consumption-advisories>

Background information and the most up-to-date shellfish growing area status reports are available here: <https://scdhec.gov/food-safety/retail-food/shellfish-monitoring-program-overview>

### **Impacts Due to Hydrologic Modification and other Pollution**

It may be difficult to evaluate the overall use support of a waterbody solely by assessing available water quality data against applicable numeric and narrative water quality criteria. In such cases, other information may be used to evaluate whether designated uses for a waterbody are impacted by hydrologic alteration or other forms of pollution. It is important to note that SCDHEC does not place waterbodies on the §303(d) list of impaired waters that are not meeting designated uses due to *pollution*, but rather lists sites impaired by regulated *pollutants*. In accordance with the USEPA guidance, waters impaired due to *pollution*, such as hydrologic alteration, are identified for additional consideration. Waters identified in this subcategory of the IR are listed in Appendix A.

### **Waters of Concern**

The Department may also identify waterbodies that demonstrate degradation or are threatened for non-attainment of classified uses through the assessment methodology. In such cases, SCDHEC does not place the waterbodies on the §303(d) list of impaired waters but will continue to evaluate these as “Waters of Concern” through the current listing cycle. A final decision regarding §303(d) list consideration will occur during a subsequent listing cycle. Waters of concern for 2022 and updates on previous waters of concern are included in Appendix B.

### **TMDL Development: Methodology for Targeting Impaired Waters**

The Integrated Report (IR) Part I: Listing of Impaired Waters serves to identify those sites that need additional management actions to meet water quality standards. Total Maximum Daily Load (TMDL) development is one way in which the Clean Water Act §303(d) was intended to promote these management actions. The Clean Water Act requires TMDLs for all impaired waters included on the §303(d) List. TMDLs or alternative restoration plans will be developed pursuant to the USEPA guidance.

A TMDL is a calculation of the maximum amount of a specific pollutant that a waterbody can receive and still meet water quality standards. It is the sum of the allowable loads of a given

pollutant from all contributing point and nonpoint sources. It also incorporates a margin of safety and consideration of seasonal variation. For impaired waters, the TMDL document specifies the level of pollutant reductions needed for waterbody use attainment. In cooperation with the USEPA Region 4, SCDHEC Bureau of Water has developed and EPA has approved over 600 TMDLs (see Appendix D). An updated listing of approved and draft TMDLs can be found on SCDHEC's TMDL webpage:

<https://www.scdhec.gov/environment/your-water-coast/impaired-waters-contaminants-limits-303d-and-tmdl>

These approved TMDLs have been incorporated into the Department's Continuing Planning Process in accordance with Section 303(e) of the Clean Water Act. TMDL development is ongoing. Prioritizing impairments for TMDL development is necessary to focus limited technical and monetary resources. This is reflected in the "Priority Rank" column of the list.

Waters and impairments that are currently identified for TMDLs or alternative restoration plan development during 2022 through 2024 will be reported to the USEPA for national tracking purposes and are listed in Appendix E. TMDLs or alternative restoration plans for other pollutants or other waters may be initiated as needed and as resources allow. Notification of commencement for all TMDLs is provided on the SCDHEC website:

<http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/TMDLsUnderDevelopment/>

### **TMDL Implementation**

The SCDHEC §319 Grant Program may provide funding for implementation of the nonpoint source component of approved TMDLs. Periodically, requests for proposals are made for projects that will implement the nonpoint source components of existing TMDLs or other projects targeting non-point sources outside of TMDL areas. Interested persons may send a message to [npsgrants@dhec.sc.gov](mailto:npsgrants@dhec.sc.gov) to be notified of grant opportunities.

There are currently 20 active 319 grant funded projects underway in the state. Implementation of TMDLs involving point sources is occurring through departmental NPDES permitting mechanisms. More information on South Carolina's implementation plans for nonpoint sources is available here:

<https://scdhec.gov/environment/your-water-coast/watersheds-program/section-319-nonpoint-source-program>

### **Guide to the List of Impaired Waters**

Waters are listed by point locations; however, the impairment is considered to extend for some distance upstream and/or downstream of the point location listed. The extent of the impairment of the waters is determined during TMDL development and implementation. The column headings included on the South Carolina §303(d) lists of impaired waters refer to the following:

**BASIN** One of eight major basins contained in the State

**HUC 12** 12-digit Hydrologic Unit Code, a sub-basin unit in which the water body is located

**DESCRIPTION** Name and brief description of the location of the impaired waters

**STATION** The Department's station code where samples were collected

**COUNTY** The county in which station is located

**IMPAIRED USE** The use that is not supported

|                              |           |
|------------------------------|-----------|
| Aquatic Life Use:            | AL        |
| Fish Consumption:            | FISH      |
| Recreational Use (Swimming): | REC       |
| Shellfish Harvesting:        | SHELLFISH |

**CAUSE(S)** Pollutant(s) that resulted in impaired classified use. The parameters are denoted as follows:

|                                |                                |
|--------------------------------|--------------------------------|
| Ammonia nitrogen: NH3          | Escherichia coli: ECOLI        |
| Chlorophyll A: CHLA            | Cadmium: CD                    |
| Chromium: CR                   | Macroinvertebrate: BIO         |
| Mercury: HG                    | Turbidity: TURBIDITY           |
| Copper: CU                     | Total Phosphorus: TP           |
| Dissolved Oxygen: DO           | Lead: PB                       |
| Enterococci: ENTERO            | Polychlorinated Biphenyls: PCB |
| Fecal Coliform Bacteria: FC    | Nickel: NI                     |
| Hydrogen Ion Concentration: PH | Zinc: ZN                       |

**STATUS** Whether the site is impaired, was not assessed, or has been delisted

**NOTE** The asterisk in the "NOTE" column indicates that there may be endangered species habitat near an AL impairment.

### Priority Ranking

In accordance with the USEPA IR guidance, priority rankings are established for development of TMDLs or alternative restoration plans 2-13 years after a site is listed as impaired by each pollutant. For the 2022 §303(d) listing cycle, each site/pollutant combination was assigned a priority ranking in one of three categories. Target dates are subject to change, based on the severity of pollution, designated use, the availability of additional site-specific information, available resources, or other factors the Department deems appropriate for scheduling TMDL or alternative restoration plan development. If the water quality standard demonstrates attainment for the pollutant of concern after initial listing, a TMDL or alternative restoration plan will not be required for the site; however, if the site is located within an ongoing priority waterbody or

watershed area, then it may remain on the priority list as a protection priority. Priority ranking will be reviewed during each IR (§303(d) listing) cycle.

A separate list of impaired sites was developed as part of EPA's long term Vision for the §303(d) program. The original list and any relevant updates are presented in Appendix E. The Vision framework concludes at the end of fiscal year (FY) 2023 and is currently undergoing revision. In anticipation of the new Vision, states are to develop a short term list of waters and pollutants targeted for TMDLs or alternative restoration plans that will be addressed during FY 2023-2024. These priorities "bridge" the period between the current Vision and the next. These bridge restoration priorities are ranked "1" in Appendix E.

### **Priority Rank Categories**

- 1) **Current Priorities** are those site/pollutant combinations being addressed by TMDL or alternative restoration plans being developed during the 2022 - 2024 time-frame.
- 2) **Near-Term Priorities** are those site/pollutant combinations that will be addressed by TMDL or alternative restoration plans being developed during the 2024 - 2026 time-frame.
- 3) **Long-Term Priorities** are those site/pollutant combinations being addressed by TMDL or alternative restoration plans being developed after 2026.

In the list of impaired waters, all pollutants are assigned a priority rank. There may be more than one pollutant for a sampling station. If all pollutants are assigned the same priority, then only the appropriate rank number is found in the Priority Rank column. If the pollutants have different priority ranks, then this is noted in the Priority Rank column.

The South Carolina 2020 and 2022 §303(d) lists of impaired waters are presented side by side in the following table. All sites assessed as impaired for the 2018 listing cycle were either 1) assessed again for the listed pollutant, or 2) if not reassessed, the pollutant was carried forward to the 2020 list. Similarly, all sites assessed as impaired for a pollutant for the 2020 list were either reassessed, or if impaired and not reassessed, carried forward to the 2022 list. If a site was not assessed during the 2020 assessment window but was included in the 2022 assessment, this is stated in the "2020 STATUS" column and the "2020 USE" and "2020 CAUSE" columns are marked "NA".

Delistings are only included in the "2022 STATUS" column to clarify the outcome of some of the impaired sites assessed for the 2020 list. The complete list of site/parameter combinations removed from the 2018 and 2020 lists of impaired waters may be seen in Appendix C.

## 2020 AND 2022 COMBINED 303(D) LIST OF IMPAIRED WATERS

**Appendix A:**  
**Impacts Due to Hydrologic Modification and other Pollution**  
**(IR Category 4C Waters)**

**Upper Saluda River:**

On August 31, 2017, DHEC received a petition from South Carolina Rivers Forever (SCRF) to designate the 14-mile section of the Saluda River downstream of the Saluda Lake Dam to the headwaters of Piedmont Lake as a hydrologically impaired waterbody under Category 4C of the South Carolina 2018 Integrated Report (IR). SCRF is a coalition of conservation organizations and they contend that aquatic life and recreational uses in this stretch of the Saluda River have been impaired due to hydrologic alterations caused by the operation of the Saluda Lake Dam.

SCDHEC does not place waterbodies impaired due to hydrologic alterations on the 303(d) List of Impaired Waters. The 303(d) List is reserved for those waterbodies that are impaired due to a regulated pollutant for which a Total Maximum Daily Load (TMDL) is required. Category 4C of the Integrated Report is reserved for those waterbodies that are impaired due to pollution that is not caused by a pollutant load, so a TMDL is not needed.

SCDHEC agrees with SCRF that aquatic life and recreational uses in the 14-mile section of the Saluda River downstream of the Saluda Lake Dam are impaired due to hydrologic alterations. This impairment is not the result of a pollutant and thus, DHEC is listing this segment under IR Category 4C.

## **Appendix B:**

### **Waters of Concern**

The 2018 IR Appendix B included a list of 172 sampling sites that were waters of concern (WOC). These were sites that required additional investigation in order to determine their support of aquatic life use due to possible impairments by lead (Pb), cadmium (Cd) or copper (Cu). These sites lacked some or all of the data necessary for calculating sample specific criteria for the metal in question. TSS and hardness data collected simultaneously with water samples intended for metals analyses were subsequently obtained for most of these sites and an assessment was completed. The following table lists these sites and their resolution.

This list also includes new waters of concern. These sites, along with any others from the 2018 WOC list that have not yet been resolved will be scheduled for further investigation during the next listing cycle. While not currently included on the §303(d) List of Impaired Waters, these locations have the potential to be listed as impaired in 2024.

\*Status based on sampling data from surrounding sites. For more information, see: [https://scdhec.gov/sites/default/files/media/document/final\\_Pb\\_report\\_Oct\\_2020\\_0.pdf](https://scdhec.gov/sites/default/files/media/document/final_Pb_report_Oct_2020_0.pdf)

\*\*Site to be sampled and assessed for future IR cycle.

\*\*\*Sampled in 2021, assessed as not impaired. WOC status will be removed next IR cycle.

## **Appendix C:**

### **Sites Not Included on the 2020-2022 Combined 303(d) List Due to Standard Attainment, Identified Pollutant or Listing Error**

Because this IR includes two listing cycles, the following table includes delistings from 2018 as well as 2020. Site/pollutant combinations that were impaired in 2018, but not 2020 or 2022 are marked with an asterisk. The table also includes site/pollutant combinations that were impaired in 2020, but not in 2022. Some of these were impaired in 2018, and some were not. These site/pollutant combinations are not marked with an asterisk.

## **Appendix D:**

### **Sites Located Within an Approved TMDL Watershed**

This appendix includes a complete list of monitoring sites where approved TMDLs have been developed for the pollutant of concern. Because TMDLs are developed for each pollutant of concern, a site may be included in this appendix multiple times by pollutant. The presence of an approved TMDL does not necessarily mean that the water quality standard has been met (or attained) for the pollutant of concern; however, 40 CFR 130.7 indicates the presence of a TMDL is “good cause” for not including a monitoring site on the §303(d) list for the pollutant of concern. Attainment of the water quality standard should be achieved once a TMDL has been implemented.

Water Quality data continue to be collected following TMDL development and assessment of data may indicate impairment for the pollutant of concern. In some cases, monitoring sites were not impaired when the TMDL was initially developed but have since become impaired for the pollutant of concern. New sampling sites may also be established and subsequent data assessment may reveal that these sites are impaired. In either situation, if a site is located within the targeted watershed area for which a TMDL was developed, it is considered to be included in the scope of the relevant USEPA-approved TMDL document. For the purposes of developing this appendix, sites have been categorized as either “in a TMDL area” (InTMDL), where the site was impaired at the time of TMDL development, or “within an approved TMDL area” (WnTMDL), where the site became impaired after the initial TMDL was developed and approved for the targeted watershed area. Both categories of sites are not included on the §303(d) list because the TMDL targets and percent reductions prescribed for the watershed area, once implemented, should result in attainment of the water quality standard in the entire watershed for the pollutant of concern.

Appendix D includes all approved TMDL sites, descriptive information, development category, and SCDHEC technical document number for reference. TMDL targets and percent reductions for monitoring sites may be found in the USEPA-approved TMDL documents:

<https://www.scdhec.gov/environment/your-water-coast/impaired-waters-contaminants-limits-303d-and-tmdl/approved-tmdls>

TMDL targets and percentage reductions for sites “within a TMDL area” are based on the nearest applicable monitoring sites with prescribed loadings as defined in the relevant TMDL document.

## **Appendix F: 2020 Data Solicitation July 16, 2019**

**NOTE:** The South Carolina's 2018 Integrated Report (2018 IR) is currently being finalized. This report includes the 2018 303(d) list of impaired waters (2018 IR Part I). An initial draft of the 303(d) list and associated appendices was made available for public comment from November 5, 2018 – December 5, 2018. Since that time, SCHDEC (the Department) has been drafting responses to all comments received during that time-frame. A complete responsiveness summary will be provided to all commenters at a later date and as the 2018 IR is finalized.

**Development of South Carolina's 2020 Integrated Report (2020 IR) is proceeding.** This report will include the 2020 303(d) list of impaired waters (2020 IR Part I). DHEC solicits and considers all existing and readily available water quality data, including non-DHEC data in development of the 2020 303(d) list. Therefore, the Department is actively soliciting for all of the relevant water quality data from academic institutions, other state, federal agencies and regulated investor-owned public utilities serving South Carolina. The Department is also directing this solicitation to other parties who have previously submitted water quality data for the aforementioned purpose.

Data should be submitted no later than **September 1, 2019** for consideration in the 2020 303(d) listing cycle. Data submitted after that time will be considered during the subsequent listing cycle. Note that 2020 303(d) listing cycle will consider relevant data from the 2014-2018 time-frame (five-year period).

More on the 303(d) List of impaired waters:

South Carolina develops an Integrated Report every two years. DHEC solicits and considers all existing and readily available water quality data, including non-DHEC data, in developing South Carolina's 303(d) list. All Non-DHEC Data are accepted for consideration at any time during the listing cycle; however, only data submitted before September 1 of each odd-numbered year will be considered for the following year's 303(d) list. To be considered for the any 303(d) list, data must be representative of current water quality conditions and comparable to state water quality criteria. Any organization submitting data should use laboratories certified by the DHEC Office of Environmental Laboratory Certification for the test methods of record.

Persons wishing to collect water quality data for DHEC use are encouraged to contact the DHEC Office of Environmental Affairs Administration and submit a Quality Assurance Project Plan (QAPP) for approval prior to initiating sampling. For the Department to use any non-DHEC data in development of the 303(d) list, submittal of non-DHEC data should be accompanied with an approved QAPP.

Additional information regarding DHEC QAPP development can be found at the following link: <https://www.scdhec.gov/quality-assurance-plans>

**For the 2020 listing cycle, the relevant time-frame for data collection is 2014-2018. For consideration in development of the 303(d) list, data must be submitted electronically. The following format is DHEC-approved for the electronic submittal. See <https://scdhec.gov/sites/default/files/docs/HomeAndEnvironment/Docs/DATATemplate.xls> for a downloadable Excel file. Note that an organization ID should be obtained from Bryan Rabon at [raboneb@dhec.sc.gov](mailto:raboneb@dhec.sc.gov) prior to data submittal.**

If you have data that you would like DHEC to consider in developing South Carolina's 303(d) list, please e-mail Matt Carswell at [carsweme@dhec.sc.gov](mailto:carsweme@dhec.sc.gov).

## **2022 Data Solicitation February 8, 2021**

*South Carolina's Integrated Report Part I: 2018 303(d) list and Part II: 2018 305(b) Assessment and Reporting* were submitted to the USEPA for final approval on November 30, 2020. These submittals are collectively known as the 2018 Integrated Report (IR). The 2018 IR was finalized on December 23, 2020 after the USEPA Region 4 approved SC's 2018 303(d) list of impaired waters.

The DHEC (the Department) is currently reviewing water quality data for assessments representative of both the 2020 & 2022 IR cycles. The 2020 and 2022 assessments will be conducted concurrently. Results from both assessments will ultimately be used to develop the 2022 303(d) list of impaired waters and 2022 305(b) Report. Sites with no new data for the 2022 assessment will carry forward the prior assessment for 2020. Use support status for sites with new data will be updated based on the 2022 assessment results. This will allow DHEC to target April 1, 2022 for submittal of the 2022 IR and return to the normal integrated reporting schedule.

DHEC solicits and considers all existing and readily available water quality data, including non-DHEC data in development of the 303(d) list of impaired waters. Therefore, the Department is actively soliciting for all of the relevant water quality data from academic institutions, other state, federal agencies and regulated investor-owned public utilities serving South Carolina. The Department is also directing this solicitation to other parties who have previously submitted water quality data for the aforementioned purpose.

Data should be submitted no later than **May 7, 2021** for consideration in the 2022 IR cycle, including the 2022 303(d) list of impaired waters. Data submitted after that time will be considered during the subsequent IR cycle. Note that 2022 303(d) IR cycle will consider relevant data from the 2016-2020 time-frame (five-year period).

**Note that a data solicitation for the 2020 IR cycle was previously sent to the same recipients on July 16, 2019. Data received from interested parties for consideration in the 2020 IR cycle will also be considered in development of the 2022 IR, including the 2022 List of Impaired Waters. There is no need to resubmit those data to the Department.**

To be considered for any 303(d) list, data must be representative of current water quality conditions and comparable to state water quality criteria. Any organization submitting data should use laboratories certified by the DHEC Office of Environmental Laboratory Certification for the test methods of record.

Persons wishing to collect water quality data for DHEC use are encouraged to contact the DHEC Office of Environmental Affairs Administration and submit a Quality Assurance Project Plan (QAPP) for approval prior to initiating sampling. For the Department to use any non-DHEC data in development of the 303(d) list, submittal of non-DHEC data should be accompanied with an approved QAPP.

Additional information regarding DHEC QAPP development can be found at the following link: <https://www.scdhec.gov/quality-assurance-plans>

**For the 2022 IR cycle, the relevant time-frame for data collection is 2016-2020. For consideration in development of the 303(d) list, data must be submitted electronically. The following format is DHEC-approved for the electronic submittal. See <https://scdhec.gov/sites/default/files/docs/HomeAndEnvironment/Docs/DATATemplate.xls> for a downloadable Excel file. Note that an organization ID should be obtained from Bryan Rabon at [raboneb@dhec.sc.gov](mailto:raboneb@dhec.sc.gov) prior to data submittal.**

If you have data that you would like DHEC to consider in developing South Carolina's 2022 IR, please e-mail Matt Carswell at [carsweme@dhec.sc.gov](mailto:carsweme@dhec.sc.gov).

## Appendix G

### Public Notice

**Posted on SCDHEC Website and distributed to Email List, June 30, 2022:**

**Availability: South Carolina's Draft 2020 and 2022 Combined List of Impaired Waters**

The South Carolina Department of Health and Environmental Control (SCDHEC) is updating its list of impaired waterbodies requiring TMDLs pursuant to Section 303(d) of the Federal Clean Water Act. The list includes waterbodies not meeting the State's water quality standards after application of existing required controls for point and nonpoint sources of pollution.

Public input is being solicited regarding the draft listing, methodology and restoration priorities. The draft document may be viewed online: <https://scdhec.gov/permits-regulations/public-notices>. A copy of the draft list can also be obtained by contacting Susan Waldner, Bureau of Water, SCDHEC, 2600 Bull Street, Columbia SC 29201 or by email: [waldnes@dhec.sc.gov](mailto:waldnes@dhec.sc.gov).

Comments can be submitted by email to [waldnes@dhec.sc.gov](mailto:waldnes@dhec.sc.gov). Written comments may also be sent to address above directed to the attention of Susan Waldner. To be considered, comments regarding the draft list must be received by 5:00 PM, Monday, August 1, 2022.

**Newspaper ad published June 30, 2022:**

**Availability: South Carolina's Draft 2020 and 2022 Combined List of Impaired Waters**

The South Carolina Department of Health and Environmental Control (SCDHEC) is updating its list of impaired waterbodies requiring TMDLs pursuant to Section 303(d) of the Federal Clean Water Act. The list includes waterbodies not meeting the State's water quality standards after application of existing required controls for point and nonpoint sources of pollution. The draft list, methodology and restoration priorities are available for review and comment and may be viewed online: <https://scdhec.gov/permits-regulations/public-notices>. ## **Appendix H: Determination of Attainment of Classified Uses**

### **General Considerations**

Physical, chemical and biological data were evaluated, as described below, to determine if water quality met the water quality criteria established to protect the State classified uses defined in Regulation 61-68, Water Classifications and Standards. Some waters may exhibit characteristics outside the appropriate criteria due to natural conditions. Such natural conditions do not constitute a violation of the water quality criteria. To determine the appropriate classified uses and water quality criteria for specific waterbodies and locations, refer to Regulation 61-69, Classified Waters, in conjunction with Regulation 61-68.

At the majority of the SCDHEC's monitoring stations, water samples for analysis are collected as surface grab samples once every month, quarter, or year, depending on the parameter. In addition, there are a number of locations monitored monthly for one year only. Grab samples collected at a depth of 0.3 meters are considered a surface measurement. At most stations sampled by boat, dissolved oxygen and temperature are sampled as a water column profile, with measurements being made at either a depth of 0.3 meters below the water surface and at one-meter intervals to the bottom or at 0.3 meters, bottom and mid-depth. At stations sampled from bridges, these parameters are measured only at a depth of 0.3 meters. For the purpose of assessment, only surface samples are used in Standards comparisons and trend assessments. Samples are collected and field measurements conducted following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--Analytical Services and Laboratory Procedures Manual for Environmental Microbiology-- Analytical Services.

Results from water quality samples can be compared to State Standards and USEPA criteria, with some restrictions due to time of collection and sampling frequency. For certain parameters, the sampling frequency employed in the ambient monitoring network is insufficient for strict interpretation of the Standards. The USEPA does not define the sampling method or frequency other than indicating that it should be "representative". The grab sample method is considered to be representative for the purpose of indicating excursions relative to criteria, within certain considerations. A single grab sample is more representative of a one-hour average than a four-day average, more representative of a one-day average than a one-month average, and so on; thus, when inferences are drawn from grab samples relative to criteria, sampling frequency and the intent of the criteria must be weighed. When the sampling method or frequency does not agree with the intent of the particular standard, any conclusion about water quality should be considered as only an indication of conditions, not as a proven circumstance. Regardless of the number of samples, no monitoring site will be listed as partially or not supporting for any pollutant based on a single exceedance of a water quality standard because of the possibility of an anomalous event.

Macroinvertebrate community structure is analyzed routinely at selected stations as a means of detecting adverse biological impacts on the aquatic fauna of the state's waters due to water quality conditions which may not be readily detectable in the water column chemistry.

The statewide assessment is generally based on the last five years of available data. For developing the 2020 §303(d) list, updated use attainment determinations were generally made using water quality data collected from 2014-2018. For developing the 2022 §303(d) list, updated use attainment determinations were generally made using water quality data collected from 2016-2020. Following is a description of how this assessment is used to determine use support:

### **Aquatic Life Use Support**

One important goal of the Clean Water Act and State Standards is to maintain the quality of surface waters to provide for the survival and propagation of a balanced indigenous aquatic community of fauna and flora. The degree to which aquatic life is protected (Aquatic Life Use Support) is assessed by comparing important water quality characteristics and the concentrations of potentially toxic pollutants with numeric criteria.

Support of aquatic life uses may be determined based on the percentage of numeric criteria excursions and, where data are available, the composition and functional integrity of the biological community. A number of waterbodies have been given waterbody-specific criteria for pH and dissolved oxygen (DO), which reflect natural conditions. To determine the appropriate numeric criteria and classified uses for specific waterbodies and locations, please refer to Regulation 61-68, Water Classifications and Standards and Regulation 61-69, Classified Waters.

For DO and pH, if 10 percent or less of the samples contravene the appropriate criterion, then the criterion is said to be fully supported. A percentage of criterion excursions greater than 10 does not support of the criterion, unless excursions are due to natural conditions. Nonsupport of the appropriate criterion results in the location being listed as impaired for DO or pH, unless excursions are due to a natural condition.

For toxicants (heavy metals, priority pollutants, chlorine, ammonia), for any individual pollutant, if the appropriate acute and/or chronic aquatic life criterion is exceeded more than once in three years (2016-2018 or 2018-2020, depending on the relevant listing cycle), the location is listed as impaired for the pollutant of concern. The Department also used discretion, considering factors other than excursion magnitude and frequency, in order to determine the impairment status due to toxicants.

Total recoverable metals (TRM) criteria are adjusted to take into consideration the dissolved fraction and to account for solids partitioning. The Department pairs instream TSS and hardness values collected concurrently with the TRM sample to calculate a sample specific instream criterion for the metal. Calculations are specific for each metal and are based on the equations established to protect the State classified uses as promulgated in Regulation 61-68, Water Classifications & Standards. The measured instream TRM values are compared to the

calculated acute and chronic criteria to determine if an exceedance of the standard has occurred.

An alternate approach may be used in situations where paired instream TSS or hardness data are not available. The method is consistent with guidance set forth in the "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria" October 1, 1993, Martha G. Prothro (<https://www3.epa.gov/npdes/pubs/owm0316.pdf> and 40CFR'131.36(b)(1)). Under this approach, a default TSS value of 1 mg/L is used in instances where there are no instream TSS data available. If the TRM criteria are hardness based, a default value of 25 mg/L is used for waters where there are no hardness data available. It is important to note that utilizing this alternate method to calculate instream criteria does not result in an immediate 303(d) impaired waters listing. Instead, water found to be exceeding the instream TRM criteria more than once in a three-year period is considered to be a "Water of Concern" through the current listing cycle and until such time instream TSS and hardness data are available to calculate a sample specific criterion for the water of concern.

For turbidity in all lakes, and for waters with numeric total phosphorus, total nitrogen, and/or chlorophyll-a criteria, if the appropriate criterion is exceeded in more than 25 percent of the samples, aquatic life use is not supported and the location is listed as impaired. For waters with contraventions of standards between 10% and 25%, further site-specific evaluation, including but not limited to consideration of prior listings, is necessary to determine if standards violations indicate actual aquatic life use impairment or if water quality standards are fully attained.

For turbidity in streams, if the appropriate criterion is exceeded in more than 10 percent of the samples, aquatic life use is not supported, and the location is listed as impaired.

For other aquatic life use support criteria, both partial support and nonsupport of the appropriate criterion result in the location being listed as impaired for the pollutant of concern; however, regardless of the number of samples, no monitoring site will be listed as not supporting for any pollutant based on a single water chemistry sample result because of the possibility of an anomalous event.

For aquatic life uses, the goal of the Standards is the protection of a balanced indigenous aquatic community. Therefore, biological data are the ultimate deciding factor, regardless of chemical conditions. If biological data showed a healthy, balanced community, the use is considered supported even if chemical parameters do not meet the applicable criteria.

### **Macroinvertebrate Data Interpretation**

Macroinvertebrate community assessment data are used to directly determine Aquatic Life Use Support and to support determinations based on water chemistry data. Macroinvertebrate community data may also be used to evaluate potential impacts from the presence of sediment contaminants. Aquatic and semi-aquatic macroinvertebrates are identified to the lowest practical taxonomic level depending on the condition and maturity of specimens collected.

The EPT Index and the North Carolina Biotic Index (BI) are the main indices used in analyzing macroinvertebrate data. To a lesser extent Taxa Richness and total abundances may be used to help interpret data. The EPT Index or the Ephemeroptera (mayflies) - Plecoptera (stoneflies) - Trichoptera (caddisflies) Index is the total taxa richness of these three generally pollution-sensitive orders. EPT values are compared with least impacted regional sites. The biotic index for a sample is the average pollution tolerance of all organisms collected, based on assigned taxonomic tolerance values.

Taxa richness is the number of distinct taxa collected and is the simplest measure of diversity. High taxa richness is generally associated with high water quality. Increasing levels of pollution progressively eliminate the more sensitive taxa, resulting in lower taxa richness. Total abundance is the enumeration of all macroinvertebrates collected at a sampling location. When gross differences in abundance occur between stations this metric may be considered as a potential indicator.

### **Recreational Use Support**

The degree to which the swimmable goal of the Clean Water Act is attained (Recreational Use Support) is based on concentration of indicator bacteria present in a waterbody. For recreational use support determination, nonsupport of the appropriate criterion result in the location being listed as impaired for the pollutant of concern.

For development of 2020 and 2022 Combined §303(d) List, any site determined to be impaired for freshwater recreational use will be listed for *Escherichia coli* (*E. coli*). This includes sites where no pathogen indicator data are being assessed from the relevant time-frames (2014 – 2018 for the 2020 list and 2016 – 2020 for the 2022 list) but are being carried over as impaired from the 2018 or 2020 §303(d) listing cycle.

Where sufficient data are collected to evaluate against the geometric mean component of the *E. coli* standards, a percentage of criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list. In most cases, insufficient data are collected to evaluate against the geometric mean component of the standard as prescribed in R. 61-68; therefore, evaluation against the single sample maximum (SSM) criterion is necessary. A percentage of SSM criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list.

For development of 2020 and 2022 Combined §303(d) Lists, any site determined to be impaired for tidal saltwater recreational use will be listed for Enterococci. This includes sites where no pathogen indicator data are assessed from the relevant time-frames (2014 – 2018 for the 2020 list and 2016 – 2020 for the 2022 list) but are being carried over as impaired from the 2018 §303(d) listing cycle.

Where sufficient data are collected to evaluate against the geometric mean component of the Enterococci standard, a percentage of criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list. In most

cases, insufficient data are collected to evaluate against the geometric mean component of the standard as prescribed in R. 61-68; therefore, evaluation against the single sample maximum (SSM) criterion is necessary. A percentage of SSM criterion excursions greater than 10% indicates impairment of recreational use support and the location is included on the §303(d) list.

Beach advisories are issued for the period in which elevated Enterococci levels persist. Advisories may be cancelled when subsequent monitoring results demonstrate that the Enterococci standard is attained. Advisories and targeted sampling events for the purposes of cancelling advisories do not warrant listing for 303(d) purposes. Instead, an approach was developed in accordance with the USEPA guidance and South Carolina Regulations 61-68 (See <https://www.scdhec.gov/environment/pollution-types-advisories-monitoring/pollution-monitoring-services-and-advisorie/beach>).

### **Fish/Shellfish Consumption**

Fish consumption use support is determined by the occurrence of advisories on human consumption for a given location. A mercury or PCB advisory which limits fish consumption indicates nonsupport of uses.

Shellfish use support is determined by the harvesting status for a given shellfish harvesting area. Based on an evaluation against the appropriate water quality standard, elevated FC bacteria levels and/or a classification which restricts shellfish harvesting in a designated harvesting area indicates nonsupport of uses and the location may be listed as impaired for the pollutant of concern. Note that the shellfish harvesting use should not be confused with the recreational use. For the current listing cycles, there may be FC bacteria listings due to impaired shellfish harvesting although there will be no FC bacteria listings due to impaired recreational use.

### **Hydrologic Modification and other Pollution**

It may be difficult to evaluate the overall use support of a waterbody solely by assessing available water quality data against applicable numeric and narrative water quality criteria. In such cases, other information may be used to evaluate whether designated uses for a waterbody are not being met due to hydrologic alteration or other forms of pollution. It is important to note that SCDHEC does not place waterbodies on the §303(d) list of impaired waters that are not meeting designated uses due to *pollution*, but rather lists sites impaired due to *pollutants*. In accordance with the USEPA guidance, waters impaired due to *pollution*, such as hydrologic alteration, are identified for additional consideration. Waters identified in this subcategory of the IR are listed in Appendix A.

**Responsiveness Summary**

Comments were received from the following:

Reedy River Water Quality Group (RRWQG)

Upstate Forever (UF)

Carolinians United / Kerri Bishop (CU/KB)

Carolinians United / Melissa Pelletrino (CU/MP)

United State Environmental Protection Agency (EPA)

**Reedy River Water Quality Group comment:**

On behalf of the Reedy River Water Quality Group, we are submitting this comment letter on the *Draft State of South Carolina's 2020 and 2022 Integrated Report (IR) Part 1: Section 303(d) Listing of Impaired Waters* (hereafter called the 2020 and 2022 303(d) list).

As you are aware, the Reedy River Water Quality Group (Group) was formed in response to the United States Environmental Protection Agency (USEPA) and the South Carolina Department of Health and Environmental Control (SCDHEC) urging the local community to explore locally-led solutions to nutrient related water quality problems in the Reedy River watershed. The Group is made up of city, county, and state agencies, homeowners groups, conservation groups, utilities, and area citizens who have together committed to on-going restoration activities while they are developing Watershed Based Plans to manage and reduce total phosphorus and total nitrogen loading to the streams, river, and lakes in the Reedy River watershed. The Group's activities and Watershed Based Plan development are real world implementation of the USEPA's 5R alternative process and 2013 *Long-Term Vision for Assessment, Restoration, and Protection under the Clean Water Act Section 303(d) Program* (Long-Term Vision).

The Reedy River Water Quality Group celebrates the water quality improvements confirmed on the previous 303(d) lists with the delisting of the total phosphorus and chlorophyll a impairments in Boyds Mill Pond and the Reedy River Arm of Lake Greenwood. These delisting's demonstrate the current effectiveness and future potential of the Reedy River Water Quality Group and USEPA's Long-Term Vision.

SCDHEC acknowledged the Group's alternative restoration plans for Reedy River Basin Nutrients on both the 2016 and 2018 303(d) lists in the Restoration Priorities appendices. Specifically, the 2016 and 2018 303(d) lists both state that the total nitrogen and pH impairments at stations S-311 and S-308 "will be addressed through the Upper Reedy River Basin 5R restoration plan currently under development." As SCDHEC is aware, the Group's Watershed Based Plans to manage and reduce total phosphorus and total nitrogen are near completion. Our understanding is that the note acknowledging the Group's Watershed Based Plans in the Restoration Priorities appendix was left off the 2020 and 2022 303(d) as an oversight.

**Accordingly, the Reedy River Water Quality Group requests that the 2020 and 2022 303(d) lists state that the remaining nutrient related impairments in Boyds Mill Pond at Station S-311 and Lake Greenwood at Station S-308 are being addressed through the Upper Reedy River Basin 5R restoration plan currently under development.**

The Reedy River Water Quality Group commends the SCDHEC and the USEPA Region IV for their continued support in developing Watershed Based Plans in the 5R subcategory and providing the opportunity for the Group to reach decisions and to achieve its goals to protect and improve water quality.

**Response to RRWQG:**

The table in Appendix E has been amended to show that the remaining nutrient related impairments in Boyds Mill Pond at S-311 and Lake Greenwood at S-308 are being addressed through the Upper Reedy River Basin 5R restoration plan currently under development.

**Upstate Forever comment:**

Upstate Forever is a membership-based nonprofit organization working on conservation, sustainable development, and water quality issues in the Upstate region of South Carolina. We have over 5,000 members and a base of support of 40,000 people in the Upstate region of South Carolina, all of whom live, work, or recreate in or near Waters of the State, including many of the waters contained in *The State of South Carolina's 2020 and 2022 Combined Integrated Report, Part I: Section 303(d) Listing of Impaired Waters (Draft 2020/2022 303(d) List)*. We appreciate the opportunity to review the Draft 2020/2022 303(d) List and we are pleased to present the following comments.

**The Department should establish numeric water quality standards for in-stream nutrients.**

Currently, the Department recognizes both total nitrogen and total phosphorus (together, as “nutrients”) impairments in ponds and lakes to control nutrients reaching the Waters of the State. High levels of nutrients have the potential to negatively impact aquatic life, the public’s use of surface waters for recreation, and important drinking water supplies. Upstate Forever urges the Department to develop in-stream nutrient standards to further safeguard the important water resources in the State. In the interim, the Department should consider adopting the classification of “Nutrient Sensitive Waters” to recognize Waters of the State that might be currently affected by high levels of nutrients.

Resources to consider in the development of in-stream numeric water quality standards for nutrients include the [North Carolina Nutrient Criteria Development Plan](#) (2019) submitted to the United States Environmental Protection Agency by the North Carolina Department of Environmental Quality Division of Water Resources.<sup>1</sup>

Thank you for your consideration of these comments. We look forward to working with you to monitor, investigate, and to better protect the water quality and designated uses of the Waters of the State of South Carolina.

**Response to UF:**

The Department agrees that numeric water quality standards for in-stream nutrients are needed. This is true not only in South Carolina but also nationally as most states have not yet established numeric nutrient criteria for streams and rivers. The Department, in coordination with EPA, is working on developing these criteria and we will continue to evaluate the nutrient criteria adoption efforts other states. Once developed, the criteria will be adopted into the water quality standards following the established public process. Once adopted, available data will be assessed against the established standards. The Department understands the importance of this issue while acknowledging that it will take time. We appreciate the attention from Upstate Forever and others on nutrient criteria to protect all of South Carolina's waters.

**Comments from Carolinians United / Kerri Bishop (CU/KB)**

Many of the comments in the document submitted by Carolinians United do not pertain to the 303(d) list or the procedures used to compile it. Comments considered related to the assessment of water quality and the remediation of impaired waters were extracted from the document, numbered, and addressed below:

**CU/KB comment 1:**

I notice there is no approved TMDL for CW-041 or RS-12088

**Response 1 to CU/KB:**

This is correct. TMDLs have not yet been prepared for these sites. Both sites have E. coli impairments.

A TMDL (or equivalent) must be completed for all water quality monitoring sites in the state found to be impaired. Our impaired sites are assigned a priority rank for TMDL completion. The TMDL priority ranking system is a way to allocate limited resources to TMDL projects. The assigned priority rank is "3" for both RS-12088 and CW-041. A rank of "3" indicates a long-term priority scheduled for completion sometime after 2026.

Part of the TMDL process is a source assessment which takes into consideration possible sources of bacteria that may be contributing to the impairment. Bacteria in waterways may originate from many sources and sometimes sources remain elusive even after the TMDL study. Water quality monitoring station CW-041 is upstream of the New Indy Paper Mill and therefore is not impacted by discharges from the facility to the Catawba River. The fact that there are bacteria impairments upstream as well as downstream of the facility indicates that there are sources present other than or in addition to the paper mill.

In addition, like all wastewater discharges, New Indy's NPDES permit requires the effluent to meet the water quality standard for bacteria at the end of the pipe, so the permit does not allow the discharge to cause violations of the bacteria standard in the Catawba River. If a wastewater discharge exceeds permit limits for bacteria or any pollutant, then DHEC compliance and enforcement procedures are designed to correct the situation.

**CU/KB comment 2:**

How does DHEC know what is being polluted into the Catawba if it isn't testing RS-12088?

**Response 2 to CU/KB:**

RS-12088 is located approximately 5 miles downstream of the facility. This site was sampled monthly in 2012 as part of our state-wide statistical sampling plan and has not been resampled since then. Statistical sites are typically only sampled for one year. Many additional sites both up and down-river continue to be sampled. Details of the monitoring strategy may be found here:

[https://scdhec.gov/sites/default/files/media/document/SC%20State%20Monitoring%20Strategy%202022%20DHEC%20signatures\\_epasig.pdf](https://scdhec.gov/sites/default/files/media/document/SC%20State%20Monitoring%20Strategy%202022%20DHEC%20signatures_epasig.pdf)

The locations of all active and historical monitoring stations may be found on the SCDHEC Watershed Atlas: <https://gis.dhec.sc.gov/watersheds/>

Inputs of pollutants to waterbodies from regulated discharges are monitored and reported to DHEC and are required to meet effluent limits designed to achieve water quality standards in receiving waters.

**CU/KB comment 3:**

DHEC did a Water Study during 2021, but it did not include water monitoring station RS-12088. Nor did it include most of the Volatile Organic Compounds developed by New Indy's process or the Total Reduced Sulfur Compounds New-Indy is emitting with their recent actions. DHEC used < sign for some results. There was no testing for E. coli or fecal coliform.

**Response 3 to CU/KB:**

In May of 2021, DHEC undertook a special study in conjunction with the Catawba River Keeper to look for specific impacts to the river in response to the discharge from New Indy. Sites were assessed up and downstream of the facility and no difference was found that could be attributed to the facility. A link to the report may be found here:

<https://scdhec.gov/environment/environmental-sites-projects-permits-interest/new-indy-odor-investigation/new-indy-frequently-asked-questions>

The "less than" sign used in the study results reflects the limits of laboratory analytical capabilities rather than any attempt to hide information. A "less than" sign indicates that the substance was present in quantities too small to be detected or measured with accuracy.

The special study was not part of our routine ambient water quality sampling framework, the purpose of which is to compare water quality conditions against state water quality standards. For this reason, ambient water quality monitoring stations were not necessarily included in the special study. Instead, downstream locations were chosen based on the likelihood of detecting an impact from the discharge.

E. coli was not included in the special study because the study was conducted to assess the presence of pollutants that may impact aquatic life and specifically those that may have caused foam seen in the river and at Landsford Canal downstream of the facility. E. coli concentrations are used as an indicator of the fitness of water for recreation rather than aquatic life support.

**CU/KB comment 4:**

We are requesting that the Diffuser pipe coming from the New-Indy Containerboard Paper Mill, into the Catawba River, as well as WQMS CW-041, RS-12088 and Fishing Creek Reservoir be tested for Dioxins/Furans.

**Response 4 to CU/KB:**

Sampling for these compounds at these established sampling sites could be done as part of a special study. These pollutants are not part of our ambient sampling program and as such, not as part of the 303(d) process in which ambient water quality conditions are compared to existing state water quality standards. Effluent characteristics and constituents may be addressed through the facility permitting process. The facility's effluent is monitored and reported to DHEC and permit violations are handled through compliance and enforcement processes.

**Comment from Carolinians United / Melissa Pelletrino (CU/MP)**

**CU/MP Comment 1:**

We are requesting the Diffuser pipe coming from the New-Indy Containerboard Paper Mill, into the

Catawba River, as well as WQMS CW-041, RS-12088 and Fishing Creek Reservoir be tested for Dioxins/Furans. This is imperative to the MS4 Water Districts Safety.

**Response 1 to CU/MP:**

See CU/KB Response 4 above.

**Comments from EPA:**

**EPA Comment 1:**

MD-273 (Turbidity) – Data found in WQX

**Response 1 to EPA:**

MD-273 is in the 2020 assessment as impaired, and in the 2022 assessment as not impaired. Data downloaded from STORET support this. This is SFH water and the standard is 25 NTU.

**EPA Comment 2:**

S-863 (pH) – Found one pH sample in WQX from 2005

**Response 2 to EPA:**

This was in WQX under its alias: RS-17381. It was fully assessed for 2020 with BIO and E coli impaired. These impairments are carried over to 2022.

**EPA Comment 3:**

SC-034 (ECOLI) – In our pull from WQX we found 3 samples within the 2022 assessment period that are meeting the standard.

**Response 3 to EPA:**

There are 6 E coli results in WQX, all meeting the standard, from 2014 (2), 2015 (1), 2016 (1), 2017 (1). These fall in to the 2020 assessment window. The assessment protocol was that if there were no new data for the 2022 assessment window the data were not reassessed. If the standard had not been met, the impairment would have been carried forward to the 2022 assessment. The rationale behind this is that an assessment based on fewer data points with no new data is not an improvement over the previous assessment.

**EPA Comment 4:**

SV-041 (Turbidity) – found station in WQX, but only found data earlier than assessment period

**Response 4 to EPA:**

Data are in WQX under its alias: RS-17378. It is in the 2020 assessment as SV-041 with all parameters meeting the standard. It is not in the 2022 assessment for the reason described in response 3.

**EPA Comment 5:**

Station PD-227 (dissolved oxygen): 3 samples in 2016 (4.79, 4.31, 4.61), 3 samples in 2017 (4.67, 4.69, 4.86), 4 samples in 2018 (4.48, 4.57, 4.17, 4.26), 1 sample in 2019 (4.82), 2 samples in 2020 (3.94 and 4.48)

**Response 5 to EPA:**

This station has a site-specific standard of 4.0 mg/L and data show that the standard has been met.

**EPA Comment 6:**

Station PD-078 (dissolved oxygen): Technically, this station has met criteria for delisting. However, 2020 had the lowest values (5.11, 4.63, 3.59, 2.18) and the only exceedances for the assessment period.

**Response 6 to EPA:**

This station has a site-specific standard of 4.0 mg/L and data show that this standard was met. Our assessment methodology (Appendix H) states that for DO and pH, if 10% or less of the samples contravene the appropriate criterion, then the criterion is said to be fully supported. Despite some low measurements, only 5.9% of the samples did not meet the standard during the 2022 assessment window.

**EPA Comment 7:**

Station B-136 (turbidity): Exceedances were above 10% for both the 2020 and 2022 assessment periods

**Response 7 to EPA:**

This station is not listed for turbidity because the macroinvertebrate assessment showed a healthy biologic community. Our assessment methodology (Appendix H) states that for aquatic life uses, the goal of the Standards is the protection of a balanced indigenous aquatic community. Therefore, biological data are the ultimate deciding factor, regardless of chemical conditions. If biological data showed a healthy, balanced community, the use is considered supported even if chemical parameters do not meet the applicable criteria.

**EPA Comment 8:**

Could we go over how you all analyze your data for BIO?

**Response 8 to EPA:**

Generally, a site must score 3.5 or greater in our macroinvertebrate bioassessment to be fully supporting of aquatic life uses and thus not listed. Those scoring lower are partially or not supporting of aquatic life uses and are listed. In practice we use a margin of error of 0.2 so that a listed site remains listed unless it scores 3.7 or more and an unlisted site remains unlisted unless it scores 3.3 or less. There are occasions where our professional judgement will override the score. These include situations where we believe that the poor score may have been caused by conditions other than water quality (flow, water quantity etc).

Typically at least three years pass between sampling the same site - sometimes much longer.

The most current assessment and sites/years sampled on their webpage (links about 1/2 way down), as well as their SOP is found here:

<https://scdhec.gov/bow/aquatic-science-programs/macrobenthos>

**EPA Comment 9:**

In the raw data file, there are occasions where there is a LT qualifier associated with a high ECOLI result. The result column includes the highest detection limit (2419.6) and the Result\_303D column is 0. We are wondering if this is being handled correctly - should the Result\_303D value equal the highest detection limit of 2419.6? (See Example Activity ID: 21SC60WQ\_WQX-AE36284 or 21SC60WQ\_WQX-AE46574). Result Detection Condition Text column in WQX identifies these as being above the detection limit.

**Response 9 to EPA:**

This was not being handled correctly. ECOLI was reassessed for both 2020 and 2022. This reassessment resulted in the addition of 8 ECOLI impairments to the 2022 list and two delistings removed from Appendix C.

ECOLI delistings removed from Appendix C: CW-014 and CSB-001L.

ECOLI impairments added to the list: B-345, CSB-001L, CW-014, CW-016, CW-016F, CW-057, RL-19154, ST-001.

**EPA Comment 10:**

Station CSB-001L (ECOLI): The exceedances here were above the 10% assessment threshold.

**Response 10 to EPA:**

This impairment was added to the list after the reassessment.

**EPA Comment 11:**

Station CW-014 (ECOLI): There were 6 occasions (including one with a value that potentially exceeds the DL) where the SSM was exceeded. This exceeds the 10% assessment threshold.

**Response 11 to EPA:**

This impairment was added to the list after the reassessment.

**EPA Comment 12:**

Station PD-700: We have found some data within WQX for stations that are not present in the data raw data spreadsheets we were provided. For example, there is no data for PD-700 in the spreadsheet, but in WQX there is data from 2019-2020, and looking at the ECOLI data it

indicates impairment. There is not a match for the activity ids, so it does not seem like the WQX data is associated with another station. This station is also not present in the GIS files.

**Response 12 to EPA:**

Data for PD-700 were not uploaded to WQX until after the assessment was begun. The ECOLI impairment at this site was added to the list and the station was added to the GIS shapefile.

**EPA Comment 13:**

Station SC-010: total phosphorus data indicates exceedance is still between 10-25%, however, there are several nearby stations in Lake Marion with TP impairments. What is it the basis for delisting?

**Response 13 to EPA:**

This site/parameter was delisted in error. It was removed from Appendix C and the impairment was added to the list.

**EPA Comment 14:**

Station SV-642: could not find this station in the file from Bryan, in WQX or in the equivalent stations file.

**Response 14 to EPA:**

SV-642 is a fish tissue-only site and not all fish tissue data are in WQX. The mercury impairment at this site was delisted in error. It was removed from Appendix C and the impairment was added to the list.

**EPA Comment 15:**

Could you explain the assessment methodology for the geometric mean portion of E. coli/Enterococci in detail?

**Response 15 to EPA:**

We assess both the geometric mean (if data are sufficient) and the single sample maximum for E coli and enterococcus. The site will be listed as impaired if either (or both) of these have exceedances of greater than 10%. The geometric mean is not based on a month-by-month analysis, but rather a 30-day, non-rolling window that begins at the start of the assessment period.

**EPA Comment 16:**

S-013 - Appears to have Pb exceedances on 2019-02-12 and 2020-05-18

**Response 16 to EPA:**

This site/parameter was added to the list of impaired waters and corrected in Appendix B.

**EPA Comment 17:**

CW-016 - Appears to have Pb exceedances on 2018-01-31 and 2018-04-25

**Response 17 to EPA:**

This site/parameter was added to the list of impaired waters.

**EPA Comment 18:**

CW-016 – Appears to have Cu exceedances on 2017-01-05, 2018-04-25, and 2019-01-10

**Response 18 to EPA:**

This site/parameter was added to the list of impaired waters.

**EPA Comment 19:**

CW-036 – Appears to have Pb exceedances on 2018-08-07 and 2020-03-25

**Response 19 to EPA:**

This site/parameter was added to the list of impaired waters and corrected in Appendix B.

**EPA Comment 20:**

BL-001 - Appears to have Pb exceedances on 2019-03-04 and 2020-03-25

**Response 20 to EPA:**

This station is not listed for lead because the macroinvertebrate assessment showed a healthy biologic community. Our assessment methodology (Appendix H) states that for aquatic life uses, the goal of the Standards is the protection of a balanced indigenous aquatic community. Therefore, biological data are the ultimate deciding factor, regardless of chemical conditions. If biological data showed a healthy, balanced community, the use is considered supported even if chemical parameters do not meet the applicable criteria.

From R.61-68, E. 14. d. (2): If the ambient concentration is higher than the numeric criterion for toxic pollutants, the criterion is not considered violated if biological monitoring has demonstrated that the instream indigenous biological community is not adversely impacted.

**EPA Comment 21:**

BRRC, SC-014, S-955 – geomean exceedances found. The assessment methodology reads shall not list based on a single water chemistry sample result, a geometric mean is not a single water chemistry sample result.

**Response 21 to EPA:**

There was only one exceedance of the geomean during the assessment window at each of these sites. We do not list sites as impaired based on a single exceedance. The intent of the methodology language was that no monitoring site will be listed as partially or not supporting for any pollutant based on a single exceedance of a *water quality standard* because of the possibility of an anomalous event. The wording in Appendix H has been changed to reflect this. See response 15 for more on assessment methodology.

**EPA Comment 22:**

CRK05 – Appears to have E coli exceedance over 10% and its omission from draft list isn't caused by censored data. This has a 2419.60 result but isn't censored. As I can't find these samples in WQX I can't see if there's a difference between this one and other 2419.60 samples. Not in WQX, or in GIS file provided.

**Response 22 to EPA:**

This station was inadvertently excluded from the assessment. Analysis of the data shows exceedances greater than 10%. This site is in the Gills Creek watershed which is covered by a bacteria TMDL. It has been added to Appendix D. The site has been added to the GIS shapefile.

**EPA Comment 23:**

CRK10 - Appears to have exceedance over 10% and its omission from draft list isn't caused by censored data. Not in WQX, or in GIS file provided

**Response 23 to EPA:**

This station was inadvertently excluded from the assessment. Analysis of the data shows exceedances greater than 10%. It has been added to the list of impaired waters. The site has been added to the GIS shapefile as well.

**EPA Comment 24:**

E-590 – Appears to have E coli exceedance over 10% and its omission from draft list isn't caused by censored data. No water classification but equivalent station is classification is FW-SP.

**Response 24 to EPA:**

This station was inadvertently excluded from the assessment. Analysis of the data shows E coli exceedances greater than 10%. This site is in a watershed which is covered by a bacteria TMDL (Four Hole Swamp). It has been added to Appendix D.

**EPA Comment 25:**

PD-372 – Appears to have exceedance over 10% and its omission from draft list isn't caused by censored data

**Response 25 to EPA:**

This station is in North Carolina, so although it is impaired, it will not be included on the list of impaired waters.

**EPA Comment 26:**

RT-18169 – Two out of two E coli samples exceeding depending on censored result

**Response 26 to EPA:**

This is a saltwater station. We do not have a standard for E coli in saltwater.

**EPA Comment 27:**

SSCL - latest E coli geomean exceedance on 10-2020. No classification data but appears to be near Columbia.

**Response 27 to EPA:**

There are no geomean exceedances. Only 2 samples exceed the single sample maximum or 2% of total. This station is meeting the standard.

**EPA Comment 28:**

RS-18426 - Appears to have Cd exceedances on 2018-09-05 and 2018-12-03

**Response 28 to EPA:**

This station is not listed for cadmium because the macroinvertebrate assessment showed a healthy biologic community. See response 20 for details.

**EPA Comment 29:**

CC1 - Appears to have enterococcus exceedances over 10% and several months of geomean exceedances. No classification in GIS data but appears to be in Charleston harbor.

**Response 29 to EPA:**

This station was inadvertently excluded from the assessment. 12% of the samples exceeded the standard. This impairment has been added to the list and to the GIS shapefile.

**EPA Comment 30:**

CH1B - Appears to have enterococcus exceedances over 10%. No classification in GIS data but appears to be in Charleston harbor.

**Response 30 to EPA:**

This station was inadvertently excluded from the assessment. 16% of the samples exceeded the standard. This impairment has been added to the list and to the GIS shapefile.

**EPA Comment 31:**

WAC-017 - There seems to be 6 months exceeding out of 39 with sufficient data to calculate a geometric mean. I calculate a geometric mean of 67 on 1/2017, 37.4 on 1/2018, 39.4 on 2/2018, 74.2 on 3/2018, 43.1 on 4/2020, and 52.1 on 10/2018. Additionally there's 3 ambiguous months: 2/2019, 5/2020, and 11/2020

**Response 31 to EPA:**

Data for WAC-017 were reanalyzed and the site was found to be impaired. It was added to the list of impaired waters and removed from Appendix C. Please see response 15 for analysis methodology. During the reanalysis, we discovered an error regarding the lower detection limit used. When this was rectified, two additional enterococcus-impaired sites were added to the list and one was removed:

Sites added: WAC-017, WAC-033, WAC-024

Site removed: CH2

**Other Amendments to the 2020 and 2022 State of South Carolina Integrated Report Part 1**

A total nitrogen (TN) impairment was listed in error for S-222. This impairment was removed from the list. The site remains listed for other parameters.

Shellfish harvesting site 15-20 was added to the table in Appendix C: Sites Not Included on the 2020-2022 Combined 303(d) List Due to Standard Attainment, Identified Pollutant or Listing Error. This site is now meeting the standard for fecal coliform bacteria.

An explanation was added to the title page of Appendix C to explain the organization of the table more clearly.

The restoration priority rank of the E. coli impairment at RS-19501 was changed from 3 to 1 in the list of impaired waters and this site/parameter was added to the table in Appendix E.

The county associated with RS-04376 was changed from Spartanburg to Cherokee to maintain consistency with the Agency's geospatial water quality sampling stations database.

## Addendum

Upon review of the final draft submittal document, EPA partially approved and partially disapproved SCDHEC's IR. The disapproved portion was the State's decision to not list WQM stations when a biological assessment of macroinvertebrates demonstrated a healthy biological community but other water quality parameters at that site exceeded standards. The State's decision to not list these sites was in accordance with both the assessment methodology (Appendix H) and SC Regulation 61-68 E. 14 d. (2) which states: "If the ambient concentration is higher than the numeric criterion for toxic pollutants, the criterion is not considered violated if biological monitoring has demonstrated that the instream indigenous biological community is not adversely impacted." The State also has many years of precedence for using this approach. EPA acknowledged the presence of the provision in the state regulation and recommended that DHEC remove it during the next rulemaking. DHEC has agreed with EPA to consider removing this provision during the next water quality standards review.

EPA made their proposed decision to add these sites available for public comment beginning January 13, 2023, through February 17, 2023.

The following site parameter combinations were initially assessed as unimpaired. Their status has been updated to impaired and they have been marked with a † in the list:

| BASIN    | HUC 12      | COUNTY      | STATION  | DESCRIPTION                            | IMPAIRED USE | STATUS   | CAUSE           | PRIORITY RANK |
|----------|-------------|-------------|----------|--|--------------|----------|-----------------|---------------|
| BROAD    | 03050105142 | SPARTANBURG | BL-001   | LAWSONS FORK CK AT S-42-108            | AL           | IMPAIRED | LEAD, TURBIDITY | 3             |

April 17, 2023

Ms. Jennifer Hughes  
Chief, Bureau of Water  
South Carolina Department of Health and Environmental Control  
2600 Bull Street  
Columbia, South Carolina 29201

Subject: South Carolina's 2020 and 2022 303(d) List Closeout Letter

Dear Ms. Hughes:

The purpose of this letter is to transmit to you the final decision of the U.S. Environmental Protection Agency Region 4 to add three water quality limited segments (WQLS) to South Carolina Department of Health and Environmental Control's Final 2020 and 2022 Clean Water Act (CWA) Section 303(d) Lists. The EPA partially approved the state's 2020 and 2022 Lists in its December 28, 2022 Decision Document.

The EPA issued a public notice providing for a 30-day public comment period on these additions to South Carolina's List. This notice was published to the EPA's website on January 13, 2023, and comments were accepted through February 17, 2023. We received one public comment letter from the South Carolina Water Quality Association. After considering the comments submitted during the public comment period, the EPA has not revised its decision to list the three WQLS. The Responsiveness Summary of comments is enclosed.

The EPA would like to continue to work closely with your divisions to successfully implement the CWA and achieve improvements in water quality. If you have questions concerning this matter, please feel free to contact me at (404) 562-9345 or Ms. Viola Reynolds, Chief, Monitoring, Assessment, Listing, and TMDL Section at (404) 562-8455.

Sincerely,

Denisse D. Diaz, Acting Director  
Water Division

Enclosure

cc: Mr. Wade Cantrell  
303(d), Modeling & TMDL Section Manager

Ms. Susan Waldner  
303(d) List and TMDL Coordinator

## **Responsiveness Summary of Comments on the EPA action to overlist waters on South Carolina’s 2020 and 2022 303(d) Lists**

The EPA, after consideration of all comments received, is continuing to proceed with its decision regarding the listing of three water quality limited segments (WQLS). The EPA has determined that the South Carolina Department of Health and Environmental Control (SCDHEC) Listing Methodology is not a reasonable method for SCDHEC to assess toxic or non-conventional pollutants consistent with the State’s applicable, EPA-approved Water Quality Standards (WQS).

We received one public comment letter from the South Carolina Water Quality Association. See the EPA Responses to these Public Comments below.

### **South Carolina Water Quality Association (SCWQA)**

#### **SCWQA Overall Comment Category 1 – South Carolina Water Quality Standards**

##### **SCWQA Comment 1A**

We understand that the existing South Carolina water quality standards are EPA-approved. The Region’s Decision Document takes the position that the subsection (d)(2) rule is not itself EPA-approved. However, the provision at issue here has been in place since at least 2014, and EPA’s approval or approvals over the years for the standards necessarily includes the incorporated application rules specifically set out in the standards regulations. Our view of the legal status of the regulatory provision appears to be confirmed (1) by DHEC and (2) by the Region’s statement that it “recommends that SCDHEC remove the biological confirmation provisions within their state regulation during the next rulemaking opportunity.” Decision Document at p. 8 (EPA Dec. 28, 2022).

##### *EPA response to SCWA Comment 1A*

*A state water quality standard (WQS) becomes the applicable WQS for purposes of the Clean Water Act when the EPA approves that standard under Section 303(c) of the CWA. 40 C.F.R. 131.21(c), (e). States can organize and format their WQS in a way of their choosing. Some states, including South Carolina within its Regulation 61-68 Water Classifications and Standards, choose to place both WQS and assessment language together within the same regulation. This can cause confusion as to what is a WQS that has been approved by the EPA, and what is assessment language. The provision at issue is not a WQS and is simply assessment methodology that while within the state’s regulation, is not itself approved by the EPA; therefore, the EPA recommends that the state remove this provision.*

##### **SCWQA Comment 1B**

In our view, the Region must act in conformity with any adopted and EPA-approved state standards. If the Region believes that the provision at issue does not conform to the CWA requirement that state standards must be adequate to protect the state’s designated uses and be properly scientifically-supported, the Region should proceed by rulemaking to disapprove the provision and, if it determines necessary, adopt an alternative federal standards provision. The Region should not do so here, because the South Carolina standards are proper and well-developed for the protection of designated uses. We

note for example that the standards in subsection (d)(1) function differently than (d)(2) and preserve the effect of unfavorable biological assessment results, irrespective of compliance with relevant numeric criteria.

### ***EPA response to SCWA Comment 1B***

*The Clean Water Act requires the EPA to ensure that impaired waters are properly identified. Proper identification of impaired waters supports the EPA and the State's shared goals to protect human health, support economic and recreational activities, ensure safe drinking water, and provide healthy habitat for fish, plants, and wildlife. The scope of the 303(d) program focuses on WQS attainment and identifying impaired waters. To achieve this objective, section 303(c)(2) calls for states, territories, and authorized tribes to adopt WQS including designated uses, narrative, and numeric criteria to protect those uses, and antidegradation policies to protect existing uses and prevent deterioration of high-quality waters. The EPA reviews and must approve or disapprove a state's 303(d) list. If the EPA disapproves a state's list, the EPA must identify the impaired waters for the state, 33 U.S.C. 1313(d)(2).*

*The biological confirmation provision is not an EPA-approved state WQS. Assessment methodology is documentation provided by states to describe and support assessment decisions. Although the EPA reviews a state's methodology as part of the List submission review, the EPA's approval of a state's section 303(d) List should not be construed as agreement with or approval of the listing methodology.*

## **SCWQA Overall Comment Category 2 – EPA Does Not Have the Authority to Override South Carolina in this Matter**

### **SCWQA Comment 2A**

The Region's proposal to override the judgment of the South Carolina Department of Health and Environmental Control and to add impaired waters listings to the 2020 and 2022 DHEC 303(d) listings is contrary to law because it is in direct contravention of the State's standards. The Region may not avoid the CWA statutory process of objections to and formal actions on state water quality standards provisions through the mechanism of rejection of a state's application of its own standards (where as here that application is clearly consistent with the standards regulation).

### ***EPA response to SCWA Comment 2A***

*As stated above in the EPA comment 1B, the CWA requires the EPA to ensure that impaired waters are properly identified by states. In accordance with Section 303(d)(1)(A) of the CWA, "[e]ach State shall identify those waters within its boundaries for which the effluent limitations. . . are not stringent enough to implement any water quality standard applicable to such waters." These waters would then comprise the state's CWA Section 303(d) list. South Carolina Regulation 61-68 Section E. 14 d. is a section within the regulation called "Evaluation of Ambient Water Quality." This section contains ten assessment methodologies, including the provision of issue, number (2), which states that if the ambient concentration is higher than the numeric criterion for toxic pollutants, the criterion is not considered violated if biological monitoring has demonstrated that the in-stream indigenous biological community is not adversely impacted, is not an EPA-approved water quality standard and, therefore, is not an applicable WQS for purposes of the CWA. In accordance with its authority in CWA Section 303(d), the EPA disapproves the state's decision to not list WQLSs when a biological assessment of*

*macroinvertebrates scores over a certain amount, but other readily available data indicate impairment for one or more parameters. The state's decision is inconsistent with Section 303(d) of the CWA and the implementing regulations set forth at 40 C.F.R § 130.7.*

## **SCWQA Comment 2B**

EPA May Not Use “Independent Applicability” to Override the South Carolina Standards. We also note the Region’s statement that “EPA views biological criteria as one component of a comprehensive water quality standards program that works in concert with – not in place of – the use of [numeric] water quality criteria.” Decision Document at p. 3. This appears to be a reference to EPA’s sometimes stated policy of “Independent Applicability,” wherein EPA takes the position that instream biological assessments (such as those at issue in the two assessment segments) or whole effluent toxicity testing results may not be used to affect the water quality conclusions that would otherwise result from an exceedance of numeric criteria. However, the concept of “Independent Applicability” is nowhere incorporated in EPA statutes or regulations, and in our view, it may not be used as the Region attempts to use it here to counteract and overrule a state’s duly promulgated water quality standards. Further, the states’ frequent use of “screening criteria” (frequently for nutrient criteria) or other standards approaches that would on their face contravene Independent Applicability, and EPA approval of such standards approaches, illustrates the non-binding nature of any Independent Applicability concept or any EPA preference for such a concept.

## ***EPA response to SCWA Comment 2B***

*States must adopt water quality criteria that protect the designated use (40 C.F.R. Part 131) with the goal of maintaining the biological integrity of the Nation’s waters and prohibiting the discharge of toxic pollutants in toxic amounts (Section 101(a) of the Clean Water Act), and assessments must be based on these applicable WQS.*

*The EPA maintains that the State’s Listing Methodology contains protocols that are not consistent with the requirements of the CWA. The EPA has stated that “chemical specific assessments are ideal for predicting the likelihood of ecological impacts where they may not yet have occurred because...critical exposure conditions have not yet been experienced by the aquatic community.” It further states that “Basing regulatory and management decisions on chemical assessment of water quality is an important and proven aspect of water quality assessment and protection” Water Quality Standards Regulation; Proposed Rule 63 Fed. Reg. (page 36,796) (July 7, 1998).*

*The EPA is unaware of any other of the State's WQS being applied conditionally rather than independently. The State has narrative nutrient criteria for all waters and numeric nutrient criteria for large lakes. The EPA does not have a policy against the use of biological assessments in interpreting narrative standards for pollutants, like nutrients, which are naturally present and desirable at some level in all waterbodies. The EPA has also written on the use of biological assessments in establishing nutrient WQS<sup>1</sup>. Once established, the numeric criteria are applied independently as is the case in South Carolina Regulation 61-68 Section E. 11 b.*

---

<sup>1</sup> Using Stressor-response Relationships to Derive Numeric Nutrient Criteria. <https://www.epa.gov/sites/default/files/2018-10/documents/using-stressor-response-relationships-nnc.pdf> (November 2010)

## **SCWQA Overall Comment Category 3 – The Proposed Listings are Unnecessary to Protect Designated Uses**

### **SCWQA Comment 3A**

It is difficult to see in a case such as this, where biological assessments for the two assessment segments at issue document a healthy instream indigenous biological community, what benefit is to be achieved by listing the waters as currently impaired. They are clearly and demonstrably not impaired. The Region states a concern that “biological assessments have limited ability to predict and prevent impacts – they can only observe harm after it has occurred.” Decision Document at p. 3. But it seems strange to conclude that real-life, real-time biological assessment of the exact segment at issue would be a less accurate or less reliable indicator of impairment than the default (derived from EPA national water quality criteria) numeric criteria. It is also the case that the states’ biological assessment procedures and thresholds include elements of conservatism (analogous to the conservatism inherent in numeric criteria), and the routine and over the years repetitive assessment programs of the states, combined with the state and EPA programs that would address any new discharges to the segments at issue, are adequate to identify any negative trends in the actual biological conditions of the states’ waters.

### ***EPA response to SCWA Comment 3A***

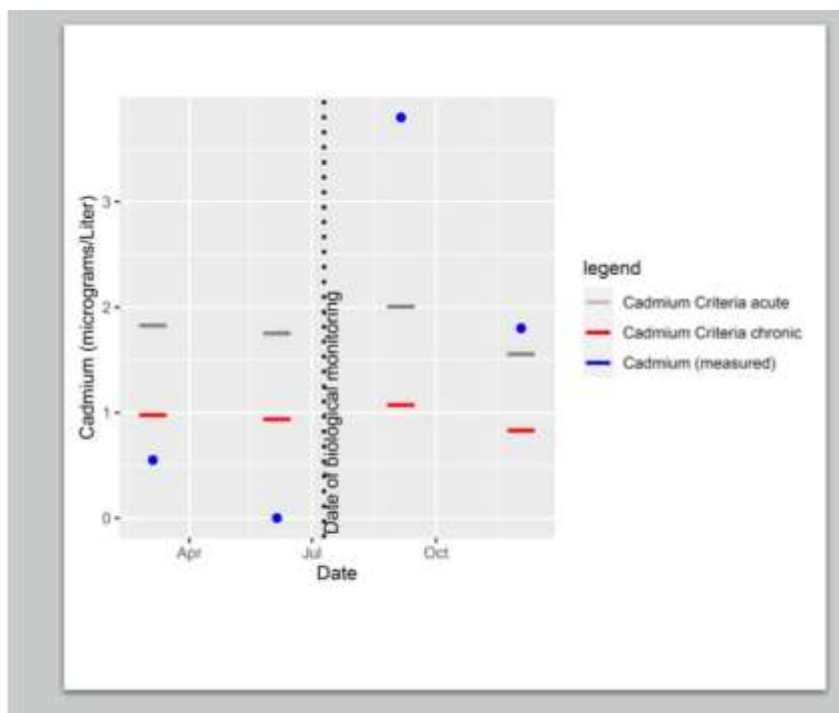

*It is the EPA’s view that, “...while biological assessments can provide information in determining the cumulative effect of past or current impacts from multiple stressors, these assessments may be limited in their ability to predict, and therefore prevent, impacts.” In fact, once biological impairment has been found, by definition, that impact was not prevented and costs for determining the cause and source and needed restoration can be prohibitive (63 Fed. Register page 36,795).*

*The biological assessments are no more real-time than the assessments using water quality monitoring data. Biological data is often collected less frequently (most often years between samples) than chemical data (often sampled monthly). Relying on a single biological result over monthly chemical results does not provide the full picture of the health of a waterbody. The graph below is a very clear example of this from one the waterbodies the EPA is adding to SC’s 2020 and 2022 Lists.*

## Example: Cadmium in Little Creek, Station RS-18426

- **Biological monitoring cannot observe harms to aquatic life before they occur;**
- We see here that the biological monitoring is limited to one day that entirely precedes the observed exceedances of the cadmium criteria.

*Infrequent biological assessments leave open the possibility of not observing adverse effects that occur afterwards while chemical monitoring continues, like demonstrated in the above graph. Adverse impacts from metals can be sublethal, take place over time, and be limited to especially sensitive species. As mentioned above in EPA comment 2B, water quality criteria are adopted with the goal of maintaining the biological integrity of the Nation's waters. We want to prevent a negative trend of the biological condition of the State's waters, not observe it. The EPA maintains that all data should be used in determining impairment and making assessment decisions and that one data type cannot override an impairment of another data type.*
